# Technical Support

Symantec Technical Support maintains support centers globally. Technical Support's primary role is to respond to specific queries about product features and functionality. The Technical Support group also creates content for our online Knowledge Base. The Technical Support group works collaboratively with the other functional areas within Symantec to answer your questions in a timely fashion. For example, the Technical Support group works with Product Engineering and Symantec Security Response to provide alerting services and virus definition updates.

Symantec's support offerings include the following:

- A range of support options that give you the flexibility to select the right amount of service for any size organization
- Telephone and/or Web-based support that provides rapid response and up-to-the-minute information
- Upgrade assurance that delivers software upgrades
- Global support purchased on a regional business hours or 24 hours a day, 7 days a week basis
- Premium service offerings that include Account Management Services

For information about Symantec's support offerings, you can visit our Web site at the following URL:

[www.symantec.com/business/support/](http://www.symantec.com/business/support/)

All support services will be delivered in accordance with your support agreement and the then-current enterprise technical support policy.

## Contacting Technical Support

Customers with a current support agreement may access Technical Support information at the following URL:

[www.symantec.com/business/support/](http://www.symantec.com/business/support/)

Before contacting Technical Support, make sure you have satisfied the system requirements that are listed in your product documentation. Also, you should be at the computer on which the problem occurred, in case it is necessary to replicate the problem.

When you contact Technical Support, please have the following information available:

- Product release level

- Hardware information
- Available memory, disk space, and NIC information
- Operating system
- Version and patch level
- Network topology
- Router, gateway, and IP address information
- Problem description:
  - Error messages and log files
  - Troubleshooting that was performed before contacting Symantec
  - Recent software configuration changes and network changes

## Licensing and registration

If your Symantec product requires registration or a license key, access our technical support Web page at the following URL:

[www.symantec.com/business/support/](http://www.symantec.com/business/support/)

## Customer service

Customer service information is available at the following URL:

[www.symantec.com/business/support/](http://www.symantec.com/business/support/)

Customer Service is available to assist with non-technical questions, such as the following types of issues:

- Questions regarding product licensing or serialization
- Product registration updates, such as address or name changes
- General product information (features, language availability, local dealers)
- Latest information about product updates and upgrades
- Information about upgrade assurance and support contracts
- Information about the Symantec Buying Programs
- Advice about Symantec's technical support options
- Nontechnical presales questions
- Issues that are related to CD-ROMs, DVDs, or manuals

## Support agreement resources

If you want to contact Symantec regarding an existing support agreement, please contact the support agreement administration team for your region as follows:

Asia-Pacific and Japan	<a href="mailto:customercare_apac@symantec.com">customercare_apac@symantec.com</a>
Europe, Middle-East, and Africa	<a href="mailto:semea@symantec.com">semea@symantec.com</a>
North America and Latin America	<a href="mailto:supportsolutions@symantec.com">supportsolutions@symantec.com</a>

DRAFT

# Traditional licensing

This chapter includes the following topics:

- [About traditional licensing](#)
- [About using nbdeployutil for traditional licensing](#)
- [About the traditional licensing report](#)
- [How to reconcile the traditional licensing report](#)

## About traditional licensing

Traditional licensing is based on the total number of clients. Client information is gathered and a report is generated. The information in the report is then reconciled with actual clients in the NetBackup environment. This information then forms the basis for license fees.

## About using nbdeployutil for traditional licensing

The utility performs two steps. Data is gathered in the first step and analyzed in the second step. The following table describes the tasks to prepare a traditional license model report.

Table 1-1

Task Number	Description
Task 1	<p>Gather data from one or more master servers.</p> <p>The <code>nbdeployutil</code> utility gathers data remotely for multiple master servers from a central location, provided the master servers granted the initiating server access. The utility supports remotely collecting data from back-level master servers (NetBackup 6.5.6 and later). You must load the engineering binary that is associated with this utility onto all master servers for which you want to gather information.</p> <p>See <a href="#">“Gathering data”</a> on page 16.</p>
Task 2	<p>Run analysis on the gathered data.</p> <p>After the gather process finishes, run the <code>--report</code> option to generate the traditional license report.</p> <p>See <a href="#">“Analyzing the gathered data”</a> on page 18.</p>
Task 3	<p>Examine the results and make the necessary adjustments.</p> <p>See <a href="#">“How to reconcile the traditional licensing report”</a> on page 20.</p>

Depending on your environment, the `nbdeployutil` utility takes from a several seconds to several minutes to complete. This behavior is true for both the `--gather` and the `--report` parameters. In general, the `nbdeployutil` utility runs faster on Linux and Windows servers as compared to other platforms.

## Gathering data

The `nbdeployutil` utility contains the following options for collecting traditional data:

```
nbdeployutil --gather [--bpimagelist=options] [--capacity|
--traditional] [--client hostname1, [hostname2, hostname#] |
--clientlist=filename] [--hoursago=number] [--log=filename]
[--master=hostname] [--nolog] [--output=directory] [--runtimestats]
[--start date [--end date]]
```

Refer to the *NetBackup Commands Reference Guide* for a complete description of the parameters.

You can gather capacity data for:

- A single master server
- A remote master server

## ■ A specific set of clients

### Example 1 - Gather information for the local master server

```
root@server_01> admincmd/nbdeployutil --gather
NetBackup Deployment Utility, version
7.1.0.1_EEB1_PET2326556_SET2371026.2011.0523
Gathering license deployment information...
  Discovered master server server_01.domain.com
  failed bptestbpcd to 1 of 77 clients, for details see:
/usr/opensv/var/global/reports/20110523_175606_server_01.
domain.com/nbdeployutil-gather-20110523_175606.log
  Output for server_01.domain.com at: /usr/opensv/var/global/reports/
20110523_175606_server_01.domain.com
Gather DONE
Execution time: 9 mins 56 secs
To create a report for this master server, run one of the following:
  capacity    : nbdeployutil --report --capacity /usr/opensv/var/
global/reports/20110523_175606_server_01.domain.com
  traditional: nbdeployutil --report --traditional /usr/opensv/var/
global/reports/20110523_175606_server_01.domain.com
```

The utility generates a log file named `nbdeployutil-gather-timestamp.log` during the gathering operation. By default, the log file is created in the directory where the gathered data resides.

### Example 2 - Gather information for a remote master server

```
# nbdeployutil --gather --master=server_02.example.com
```

### Example 3 - Gather information for a subset of clients that the local master server protects

```
# nbdeployutil --gather --client=client_01,client_02,client_03
```

or

```
# nbdeployutil --gather --clientlist=filename.txt
```

---

**Note:** When you use the `--client` or the `--clientlist` option, some media servers may show up as not connectable in the report even though the utility can connect to them. This problem should not affect the summary information.

---

## Analyzing the gathered data

The `nbdeployutil` utility contains the following options for generating a traditional report:

```
nbdeployutil --report [--capacity|--traditional]
[dir1 dir2 dir# | --dirsfile=filename | --parentdir=directory]
[--log=filename] [--nolog] [--runtimestats]
```

Refer to the *NetBackup Commands Reference Guide* for a complete description of the parameters.

You can generate a report for:

- A single master server
- Several master servers

**Example 1 - Generate a report using data that is collected for the local master server**

This example is a continuation of **Example 1** from the previous topic.

```
root@server_01> admincmd/nbdeployutil --report traditional
/usr/openv/var/global/reports/20110523_175606_server_01.domain.com
NetBackup Deployment Utility, version
7.1.0.1_EEB1_PET2326556_SET2371026.2011.0523
Analyzing license deployment ...
Master server_01.domain.com
Report created at: /usr/openv/var/global/reports/
20110523_175606_server_01.domain.com/report-capacity-server_01.
domain.com-20110523_180636.xls
Analysis DONE
Execution time: 13 secs
```

The utility generates a log file named `nbdeployutil-report-timestamp.log` during the analysis and the report generating operation. By default, the log file is created in the directory where the gathered data resides.

**Example 2 – Generate a roll-up report for several master servers**

This example assumes that you have gathered the respective master server's data in directories `master1dir`, `master2dir`, `master3dir`. These directories all reside within a parent directory named `EMEA-domains`. The output (report and log file) is saved to the `EMEA-domains` directory.

```
# nbdeployutil --report traditional
--parentdir=EMEA-domains
```

This variation creates a report for a smaller set of master servers and specifies a different directory for the output.

```
# mkdir UK-masters
# nbdeployutil --report --traditional EMEA-domains/master1dir
EMEA-domains/master2dir --output=UK-masters
```

## About the traditional licensing report

This topic provides a brief explanation of how to interpret the traditional license report. The utility examines the image headers in the NetBackup catalog to determine the servers and clients in the NetBackup environment. The data that is retrieved during the data collection phase can also affect the results.

Much of the report information does not affect the final values on the **Summary** tab. The information is for information purposes only. This information is useful for reaching a better understanding of your environment.

The traditional license report is a Microsoft Excel spreadsheet with seven tabs:

- **Summary**

This tab shows the final details about master servers, media servers, and clients. This tab lists the source data for generating the report. The number of media servers and the number of clients is provided, as well as capacity information.

- **Hosts**

This tab provides a listing of host names, along with associated computer information. The associated information includes information such as: platform, computer type, database software installed, SAN media server, and NDMP.

- **NDMP**

This tab shows the computers that the utility has determined are NDMP servers and the corresponding tier number of the client. When you reconcile the report, you need to address the clients that are found on this tab.

- **Virtual Servers**

This tab shows the number of the virtual servers or the virtual hosts that were detected in the environment.

- **Drives**

This tab details the type of drives as well as the host or the library where the drive resides. The tab provides the host names that are associated with each drive as well as information about virtual tape libraries, shared drives, and vaulted drives.

- **Interpreting the results**

This tab provides a general overview of how to reconcile the information in the report with your actual environment.

- **Disclaimer**

This tab shows text explaining the limits of the report's calculations and proper use of the data. For example, the figures should not be used to audit compliance.

## How to reconcile the traditional licensing report

This topic reviews the different tabs in the report and provides an overview on the process of reconciling the report with the actual NetBackup environment. The utility generates a report in a Microsoft Excel format.

Reconciling the traditional licensing report output is a five step process.

### To reconcile the report

- 1 Examine the **Summary** tab and confirm the correct information is displayed.  
See [“Verify the Summary tab”](#) on page 20.
- 2 Review the **Hosts** tab and resolve any missing information.  
See [“Complete the Hosts tab”](#) on page 21.
- 3 Resolve any missing or any incomplete information on the **NDMP** tab.  
See [“Resolve the NDMP tab”](#) on page 22.
- 4 Update the **Virtual Servers** tab with any missing information.  
See [“Update the Virtual Servers tab”](#) on page 22.
- 5 Confirm all information on the **Drives** tab is accurate.  
See [“Confirm the Drives tab”](#) on page 22.

## Verify the Summary tab

The top of the report's Summary tab details the basis for the report's information. Review the **Period Analyzed** for the source of the information for the report. The **Period Analyzed** section includes:

- Start date for the gather for each master server.
- End date for the gather for each master server.
- The total number of days gathered for each master server.
- The input directory for each master server that is associated with the report.

The start and the end dates are not necessarily the dates that are specified for the `gather` command. These are the dates within the time period that you specified where images exist. If images do not exist for a specified start or end day, the day is not listed. The nearest date with backup images is included and listed.

The **Input Directory** column displays the path to the gathered data. Within that directory is the `nbdeployutil-gather-timestamp.log` file. If non-default inputs were used in the collection of catalog data, the log file displays this information.

Under the **Options** section, confirm the list of master servers is correct. If there are missing or extra master servers, you need to rerun the report.

When you finish your review of the entire report, all the values in the **Unknown** row under **Tiering** should be zero. As you reconcile the other tabs in the report, these values should automatically update to zero.

## Complete the Hosts tab

The **Hosts** tab provides a listing of all **media** servers and **client** servers that are included in the report. The tab includes **master** servers if they are either a media server or a client server. You need to review five areas to complete the review of this tab.

### To complete the Hosts tab

- 1 Scan the **Connectable** column and see how many hosts the utility was unable to connect to for its calculations. Be aware the utility cannot connect to NDMP filers. If there is a large number of non-NDMP filer hosts the utility could not connect to, consider rerunning the utility with the `--retry` option. Use the following command to retry the connections

```
nbdeployutil --retry <path_to_the_gathered_data>
```

When that finishes, use the following command to recreate the report.

```
nbdeployutil --report <all_previously_specified_options>  
<all_previously_specified_gather_directories>
```

- 2 Check the **Tier** column for any hosts that are listed as **UNKNOWN**. You must replace these with the appropriate tier number between one and four. Please work with your Symantec Sales Engineer to determine the correct tier information.

The **Platform** and **Processors** values help determine the host's tier. These columns do not calculate the tier, but knowing this information helps you determine the appropriate value to enter in the **Tier** column.

- 3 Review the **MSEO Key Server** column and verify all the listed information is correct. **Yes** indicates the host is an MSEO key server. **No** indicates the host is not an MSEO key server. The **N/A** value indicates the host is not a media server.
- 4 Check the **Enterprise Client** column and verify that the information is correct. **Yes** indicates the host is an enterprise client and was backed up. **No** indicates the host is not an enterprise client. The **N/A** value indicates no backups were performed on the host during the report period.
- 5 Review the **SAN Media Server** column, correct any hosts where the value is **UNKNOWN**, and confirm all other values are correct. A value of **N/A** for a host indicates the host is either a client server or a master server.

Be aware the only column which contributes to the final information on the **Summary** tab is the **Tier** column. So values of **UNKNOWN** in other columns other than **Tier** indicate unknown information. All data aside from the **Tier** column is for informational purposes only.

## Resolve the NDMP tab

The **NDMP** tab shows hosts the utility has determined to be NDMP servers. If there are servers listed which are not NDMP servers, delete these servers from the list. Add any missing NDMP servers to the list. For all servers, review the Tier column and confirm the information is correct. Any **Tier** values of **UNKNOWN** should be replaced with the correct tier number between one and four. Please work with your Symantec Sales Engineer and the *NetBackup Pricing and Licensing Guide* to determine the correct tier information.

Consult with your Symantec Sales team if any of the listed NDMP servers are NearStore servers.

## Update the Virtual Servers tab

Complete the **Virtual Servers** tab. Replace any **UNKNOWN** values under the **Used** column with **Yes** or **No**. **Yes** indicates the host uses NetBackup's ESX-specific feature and **No** indicates it does not use the feature. Add missing virtual servers to the list and indicate **Yes** in the **Used** column.

## Confirm the Drives tab

On the **Drives** tab, review the information in the **VTL** column. Verify that all virtual tape libraries are correctly listed as **Yes**. If a virtual tape library has **No** for a value in the VTL column, change that to **Yes**. Change the value for **VTL** to **No** for any drives that are incorrectly marked as a virtual tape library.

## Final steps

Once you reconcile the report, correct the errors, and enter the missing information, compare the results to the install base report. The install base report is provided to you by Symantec or your reseller. Confirm everything in the report matches up with what is contained in the install base report. If there are discrepancies, consult with your Symantec sales representative to correct problems.

DRAFT

# Capacity licensing

This chapter includes the following topics:

- [About capacity licensing](#)
- [About using nbdeployutil for capacity licensing](#)
- [About the capacity licensing report](#)
- [How to reconcile the capacity licensing report results](#)

## About capacity licensing

Capacity licensing is based on the total amount of data that is protected by NetBackup. This model differs from other NetBackup license models which are based on total clients or on total storage capacity. The total amount of protected data is calculated based on the backup image header information in the NetBackup catalog. Capacity information is gathered and a report is generated. The information in the report is then reconciled with actual capacity in use. This information then forms the basis for license fees.

To run the capacity licensing utility, the master server must meet the following requirements:

- A NetBackup master server running NetBackup 6.5.6 or later. This licensing model does not apply to NetBackup versions earlier than 6.5.6. You can run this utility from any master or any media server in the environment.
- A tool for reading .xls files. Symantec tested the utility with Microsoft Excel, but any tool for reading and editing .xls files should work.

## About Front-end Terabytes and capacity licensing

The licensing fees for the use of NetBackup are based on the total number of Front-End Terabytes (FETBs) protected by NetBackup. Front-End Terabyte

Calculation is a way of determining the total terabytes of data NetBackup protects. A Front-End Terabyte (FETB) is one terabyte of protected data. The data can either be on clients or devices where the software is installed or where the software is used to provide backup functionality.

The utility examines the image headers in the NetBackup catalog to determine the terabytes of data that NetBackup protects. Any partial terabytes of data are rounded up to the next whole terabyte. The final total is the sum of the FETBs for each client/policy combination that the analyzer examines. The utility measures the actual data protected. It does not measure the capacity of the storage where the data resides or the total amount of data that is stored on the device.

Consider the following:

- Assume a device with 100 TB of total storage capacity.
- A total of 65 TB of the total capacity is in use.
- NetBackup protects a total of 60 TB of the used data through multiple backup storage units.
- That is measured as 60 TB of front-end capacity.

The total terabytes of front-end capacity are independent of the number of copies NetBackup makes. A backup of 200 TB to basic disk with two copies to tape is still only 200TB of front-end capacity.

## About capacity usage calculation tools for capacity licensing

NetBackup provides three methods to calculate capacity usage.

OpsCenter	Provides an interface useful for multi-server environments.
<code>nbdeployutil</code>	<p>Provides a command-line access to capacity usage. It provides a richer set of input parameters and is highly customizable.</p> <p><code>nbdeployutil</code> can also be used for business unit reporting.</p> <p>The utility generates a Microsoft Excel spreadsheet which you can review and modify if capacity is over counted.</p>

**PureDisk reports** The `nbdeployutil` utility calculates capacity usage for some types of PureDisk backups. When PureDisk is used as a disk storage unit for NetBackup (the PureDisk Deduplication Option), the utility calculates the capacity used.

When PureDisk clients back up to a PureDisk storage pool authority and NetBackup is not involved, the `nbdeployutil` binary cannot be used. The binary cannot be used because no NetBackup master server is present. In the PureDisk only environment, refer to the **Capacity Usage Report**. Refer to the *Reports* chapter of the *Symantec NetBackup PureDisk Administrator's Guide* for more information about the **Capacity Usage Report**.

Symantec has setup a Web site for updates and the most recent information about the `nbdeployutil` utility.

<http://www.symantec.com/docs/TECH145972>

## About using nbdeployutil for capacity licensing

The utility performs two steps. Data is gathered in the first step and analyzed in the second.

**Table 2-1** describes the tasks to prepare a capacity deployment analysis report.

**Table 2-1** Process overview to prepare a capacity deployment analysis report

Task Number	Description
Task 1	<p>Gather catalog data from one or more master servers.</p> <p>The <code>nbdeployutil</code> utility can gather data remotely for multiple master servers from a central location, provided the remote master servers have granted the initiating server access. The utility supports remotely collecting capacity data from back-level master servers (NetBackup 6.5.6 and later).</p> <p>See “<a href="#">Gathering capacity data for capacity licensing</a>” on page 28.</p>
Task 2	<p>Report on the gathered data.</p> <p>The <code>nbdeployutil</code> utility can create three different types of reports.</p> <ul style="list-style-type: none"><li>■ A roll-up report for all gathered data</li><li>■ A report per master server</li><li>■ A report for a specific set of clients (e.g., a business unit level report)</li></ul> <p>See “<a href="#">Reporting on the gathered capacity data</a>” on page 29.</p>

Table 2-1

Process overview to prepare a capacity deployment analysis report

(continued)

Task Number	Description
Task 3	Examine the results and make adjustments.  See “ <a href="#">About the capacity licensing report</a> ” on page 30.

## Gathering capacity data for capacity licensing

The `nbdeployutil` utility contains the following options for collecting capacity data:

```
nbdeployutil --gather [--bpimagelist=options] [--capacity]
[--client hostname1, [hostname2, hostname#] | --clientlist=filename]
[--hoursago=number] [--log=filename] [--master=hostname] [--nolog]
[--output=directory] [--runtimestats] [--start date [--end date]]
[--traditional]
```

Refer to the *NetBackup Commands Reference Guide* for a complete description of the parameters.

You can gather capacity data for:

- A single master server
- A remote master server
- A specific set of clients

### Example 1 - Gather capacity information for the local master server

```
# nbdeployutil --gather
NetBackup Deployment Utility, version 7.1.0000.0000
Gathering license deployment information...
  Discovered master server marybl2g1
  Output for marybl2g1 at: D:\Program Files\VERITAS\netbackup\
  var\global\reports\20101029_170534_marybl2g1
Gather DONE
Execution time: 1 min
To create a report for this master server, run the following:
nbdeployutil.exe --report "D:\Program Files\VERITAS\netbackup\
var\global\reports\20101029_170534_marybl2g1"
```

The utility generates a log file named `nbdeployutil-gather-timestamp.log` during the gathering operation. By default, the log file is created in the directory where the gathered data resides.

**Example 2 - Gather capacity information for a remote master server**

```
# nbdeployutil --gather --master=sidon.example.com
```

**Example 3 - Gather capacity information for a subset of clients that the local master server protects**

```
# nbdeployutil --gather --client=dynamo,lettuce,marble2
```

or

```
# nbdeployutil --gather --clientlist=filename.txt
```

## Reporting on the gathered capacity data

The `nbdeployutil` utility contains the following options for generating a capacity report:

```
nbdeployutil --report [--capacity]
[dir1 dir2 dir# | --dirsfile=filename | --parentdir=directory]
[--log=filename] [--nolog] [--runtimestats] [--traditional]
```

Refer to the *NetBackup Commands Reference Guide* for a complete description of the parameters.

You can generate a report for:

- A single master server
- Several master servers
- A specific subset of clients. For example, a report that contains capacity usage for business unit billing.

More information about this option is available.

See [“Business unit reporting”](#) on page 30.

**Example 1 - Generate a report using data that is collected for the local master server**

This example is a continuation of Example 1 from the previous topic.

```
D:\>nbdeployutil.exe --report "D:\Program Files\VERITAS\netbackup\
var\global\reports\20101029_170534_maryb12g1"
NetBackup Deployment Utility, version 7.1.0000.0000
Analyzing license deployment for master maryb12g1 ...
```

```
Report created at: D:\Program Files\VERITAS\netbackup\var\global\
reports\20101029_170534_marybl2g1\report-20101029_170705.xls
Analysis DONE
Execution time: 27 secs
```

The utility generates a log file named `nbdeployutil-report-timestamp.log` during the analysis and the report generating operation. By default, the log file is created in the directory where the gathered data resides.

#### Example 2 – Generate a roll-up report for several master servers

This example assumes that you have gathered the respective master server's data in directories `master1dir`, `master2dir`, `master3dir`. These directories all reside within a parent directory named `EMEA-domains`. The output (report and log file) is saved to the `EMEA-domains` directory.

```
# nbdeployutil --report --parentdir=EMEA-domains
```

This variation creates a report for a smaller set of master servers and specifies a different directory for the output.

```
# mkdir UK-masters
# nbdeployutil --report EMEA-domains/master1dir EMEA-domains/master2dir
--output=UK-masters
```

## Business unit reporting

The utility can be used to examine a specific set of clients in detail.

**Example - Gather data for a subset of clients for a time frame different than the default.**

```
nbdeployutil.exe --gather --output BusinessUnitFinance --start "11/01/10
06:00:00" --end "11/02/10 01:00:00" --clients marybl2g1,marybl7g1
--verbose
```

To create a report for these clients, run the following:

```
nbdeployutil.exe --report "BusinessUnitFinance\20101102_155246_marybl2g1"
```

## About the capacity licensing report

This topic provides a brief explanation of how to interpret the capacity license report. This topic also details how to make the corrections that reflect your backup environment configuration. The utility examines the image headers in the NetBackup catalog to determine the amount of data NetBackup protects. How you

configure your client policy and schedule settings can affect the results. The data that is retrieved during the data collection phase can also affect the results.

The capacity license deployment report is an Excel spreadsheet with four tabs:

■ **Summary**

This tab shows the final figures, an overview of the basis for the report (data source), and a breakdown of the source of the capacity. The capacity breakdown includes a reporting by policy type and largest clients.

See [“Verify the completeness of the inputs for the capacity licensing”](#) on page 32.

■ **Itemization**

This tab shows a table similar to the line itemization you see in your credit card bill. Each line is a charge that contributes to the final total. Each line lists the capacity that is calculated for a client/policy combination.

See [“Examine the Itemization tab in the capacity licensing report for flagged conditions in the Accuracy column”](#) on page 33.

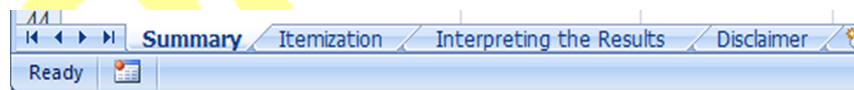

■ **Interpreting the Results**

This tab shows descriptive text. The tab contains an explanation for how to examine the report and make adjustments as needed based on the unique properties of the configuration.

See [“Examine the Itemization tab in the capacity licensing report for flagged conditions in the Accuracy column”](#) on page 33.

■ **Disclaimer**

This tab shows text explaining the limits of the report’s calculations and proper use of the data. For example, the figures should not be used to audit compliance.

## Factors influencing performance

The performance of the `nbdeployutil` utility is dependent on the system running it as well as the size of the NetBackup catalog. The gather command only executes as quickly as the `bpimagelist` command can run for 30 days worth of images.

The speed of report generation is dependent on the number of images and fragments. The operating system running the command also affects the utility’s performance. Preliminary testing at Symantec indicates this utility runs faster on Linux computers than on Windows computers.

## About the capacity licensing report

The utility generates a report in a Microsoft Excel format. This topic reviews the different tabs in the report and provides an overview on the process of reconciling the report with the actual NetBackup environment.

### Examining the results of the capacity licensing report

Examining the deployment analysis results is a four step process.

#### Examining the report

- 1 Verify the completeness of the report inputs.  
See [“Verify the completeness of the inputs for the capacity licensing”](#) on page 32.
- 2 Eliminate redundant data due to client aliases and multiple IP addresses.  
See [“Eliminate redundant data in the capacity licensing report due to client aliases and multiple IP addresses”](#) on page 33.
- 3 Examine the **Itemization** tab for flagged conditions in the **Accuracy** column.  
See [“Examine the Itemization tab in the capacity licensing report for flagged conditions in the Accuracy column”](#) on page 33.
- 4 Verify correct grouping and summation of multistreamed backup images.  
See [“Verify correct grouping and summation of multistreamed backup images in the capacity licensing report”](#) on page 35.

### Verify the completeness of the inputs for the capacity licensing

The top of the report's **Summary** tab shows the basis for the report's information. Examine the section marked **Analyzed** to verify the completeness of the gathered data upon which the report is based.

The **Analyzed** section displays the following:

- The master server(s) included in the report.
- The date range for catalog data.
- The number of clients and policies that are seen in the catalog output.

If the client and the policy counts are low, the report may be based on the data that was gathered with narrower, non-default inputs. The analyzer gathers 30 days worth of catalog data for all clients by default.

The **Input Directory** column displays the path to the gathered data. Within that directory is the `nbdeployutil-gather-timestamp.log` file. If non-default inputs were used in the collection of catalog data, the log file displays this information.

1	<b>Capacity Licensing Report</b>					
2	NetBackup Deployment Analyzer					
3	Version 7.1.0000.0000					
4	<b>Analyzed:</b>					
5	<b>Master Server</b>	<b>Start Date</b>	<b>End Date</b>	<b>Number of Days</b>	<b>Total Clients</b>	<b>Total Policies</b>
6	master1.example.com	09/27/2010	10/05/2010	7	382	373 /home/jbarr/FETB_te
7	master2.example.com	09/28/2010	10/05/2010	7	307	372 /home/jbarr/FETB_te
8	master3.example.com	09/28/2010	10/05/2010	7	10	70 /home/jbarr/FETB_te
9	master4.example.com	09/28/2010	10/03/2010	5	30	37 /home/jbarr/FETB_te

## Eliminate redundant data in the capacity licensing report due to client aliases and multiple IP addresses

The analyzer performs calculations based on the **client** name as stored in the catalog. Clients that are backed up by multiple aliases or multiple IP addresses are not collapsed into a single entry. For ease of accountability, the **Itemization** tab lists all client aliases and IP addresses used for backup separately. In some jurisdictions, the collection of the system IP address may be subject to regulation as personal data.

Determine where multiple client/policy lines refer to the same data set backed up through different interfaces. Make adjustments to the Charged Size value for all but one of the client/policy lines. We recommend retaining the value that is most recent. Annotate the duplicate client itemizations with a comment within the adjacent **Reason** cell. Indicate that the client's value is already counted under a different hostname. Please reference the hostname.

See “[Eliminate redundant counting in the capacity licensing report](#)” on page 36.

## Examine the Itemization tab in the capacity licensing report for flagged conditions in the Accuracy column

The report’s **Itemization** tab shows the calculated capacity for each client/policy combination. The report flags conditions that have the potential to over count or to under count capacity. These conditions are identified in the **Accuracy** and **Accuracy Comment** columns.

1	Master Server	Client Name	Policy Name	Policy Type	Backup Image	Backup Date	Accuracy	Accuracy Comment
26	master1	RSVB3AVSPAP00	APP14_SMS_AV	MS-Windows-NT	RSVB3AVSPAP00_1285926056	10/01/2010	OK	
27	master1	RSVB3AVSPAP02	APP14_SMS_AV	MS-Windows-NT	RSVB3AVSPAP02_1285938653	10/01/2010	OK	
28	master1	RSVB3CFPAD01	APP4-DMS-OVR-SIM-R	MS-Windows-NT	RSVB3CFPAD01_1286021066	10/02/2010	OK	
29	master1	RSVB3CFPAD01	RSVB3CFPAD01_RMA	Oracle	multiple	10/01/2010	Database Estimation (oracle)	DB size estimated via backup summation
30	master1	RSVB3CFPADP1	RSVB3CFPADP1_RMA	Oracle	multiple	10/03/2010	Database Estimation (oracle)	DB size estimated via backup summation, c
31	master1	RSVB3CFPADP1	RSVB3CFPADP1	MS-Windows-NT	RSVB3CFPADP1_1286045955	10/02/2010	Possible Overlap	Client appears in other policies
32	master1	RSVB3CFPAD01	APP4-DMS-SIM-RM	MS-Windows-NT	RSVB3CFPAD01_1286068882	10/02/2010	OK	

■ Possible overlap - Client appears in multiple policies

A client in multiple backup policies has the potential to have the same data backed up more than once. Compare the policy types and names to determine if the case warrants a detailed examination of the respective policies' backup selections.

See [“Eliminate redundant counting in the capacity licensing report”](#) on page 36.

■ Database estimation - database size estimated via UBAK summation

The size of databases that a NetBackup database agent protects cannot be determined with certainty. Third party components external to NetBackup (e.g., RMAN) govern the composition of database backups.

The third-party component determines the number of backup streams and the contents of each stream. These backups are recorded as user-initiated backup images, i.e., UBAKs. NetBackup does not **initiate** backup streams, nor does it know each stream's relationship to the **underlying** database. Therefore the information in the catalog does not **provide a single**, clear, undisputable figure for the total size.

In these cases, the analyzer calculates an estimation upon which to base follow-on examinations. The analyzer **uses the image header** information to determine the total **terabytes** of data that were backed up each day within the date range examined. A **day is defined as the 24 hour period** from midnight to midnight. The analyzer **sums all full and user-initiated** backups that started within that period. The day with the **largest** total volume of protected data during the range that is examined is assumed to be the day when a full backup of the database was **performed**. This figure that is returned is an estimate of the **approximate size of active data** under protection for the client and policy. See [“Confirm the accuracy of any database backups in the capacity licensing report”](#) on page 37.

■ Undiscoverable - No full backup found within range analyzed

The **catalog** has only incremental backups for the range analyzed. That error may **indicate** that a full backup falls outside the report's range or that a full backup does not exist.

See [“Locate policy full backup in the capacity licensing report”](#) on page 36.

■ Compressed Image

The client's data was sent to NetBackup in compressed form. The actual size cannot be determined with certainty. For all compressed backup images, the analyzer multiplies the final backup image size by a fixed value (the compression ratio). The value of the compression ratio is listed on the **Summary** tab.

See [“Review compressed image information in the capacity licensing report”](#) on page 36.

- **Size unavailable – Only snapshot is present**  
The catalog has only snapshots for the range analyzed. The analyzer requires a backup image of the snapshot in order to have an accurate figure for the client's protected capacity.  
See [“Locate full backup for snapshot image in the capacity licensing report”](#) on page 38.
- **Possible multi-stream backup detected**  
The size of clients protected by multi-stream backups is the total of all backup images created by all streams.  
See [“Determine affect of multistreamed backups in the capacity licensing report”](#) on page 37.

## Verify correct grouping and summation of multistreamed backup images in the capacity licensing report

When a client is backed up by multiple streams, the client's size is equal to the total of all backup images created by all streams. Job throttles on the policy, the client, and the storage unit hinder the utility's ability to group the streams with certainty. For example, instead of starting within minutes of one another a subset of the backup streams may start in a different day than the rest of the backup streams. Because the utility sums only the backup images from streams that originate within the same 24 hour period (midnight to midnight), these streams are counted in separate days. Manually initiating a second full backup within the same day also skews the results. Streams from both backups are counted together as a group.

See [“Determine affect of multistreamed backups in the capacity licensing report”](#) on page 37.

## How to reconcile the capacity licensing report results

After you use the utility with the `--report` option, it generates a spreadsheet. After reviewing the resulting spreadsheet you can either:

- Accept the generated information without changes as the basis for license charges.
- Make changes and note the reason for the change.

As you make changes to the spreadsheet it is important to assess when any additional changes are no longer meaningful. Since licensing charges are assessed on a per terabyte basis, it may not be beneficial to dispute charges for a few gigabytes of information. You may wish to sort the clients by their backup size and focus on the largest backups first. Sorting by backup size provides two benefits.

First, your efforts are initially focused on the largest clients. Second, if there are clients backing up only a few kilobytes, these backups may not capture the correct information. You may have important data which is unprotected.

## Verify completeness of the capacity licensing report

On the **Summary** tab, look at the information under **Analyzed**. Confirm the master server or servers is correct, as well as the date, client, and policy information.

## Locate policy full backup in the capacity licensing report

On the **Itemization** tab, sort the list by **Accuracy Column**. For all lines with **Undiscoverable**, manually query the NetBackup catalog to determine if a full backup can be found. A full backup may exist in a time period that precedes the period the analyzer examined. Rerun the utility with specific options to restrict the collection and reporting to the specific client and a specific date range within which the full backup(s) fall. Alternatively, manually examine the client system to determine the size of data that would be backed up with the backup policy's selections and settings.

## Review compressed image information in the capacity licensing report

On the **Itemization** tab, sort the list by **Accuracy Comment**. For any compressed images, review the **Charged Size** column and confirm the correct information is displayed. If the information is inaccurate, change the **Charged Size** column, and add a note to the **Enter a Reason here when modifying the Charged Size** column explaining the change.

## Eliminate redundant counting in the capacity licensing report

On the **Itemization** tab, sort the list by **Client Name** and search for the use of hostname aliases. Look for instances where the itemization table lists the same client multiple times under the same policy but with a different hostname alias. If that occurs, zero out the **Charged Size** column for the lines with an earlier backup date. Then add a note to the **Enter a Reason here when modifying the Charged Size** column explaining why the **Charged Size** value is zero.

For some Oracle RAC backups, the presence of itemizations under different aliases can reflect the backup of different data sets. If you zero out the **Charged Size** the protected data is under counted.

If a client is found in more than one policy, confirm those policies do not have overlapping backup selections. If the backup selections overlap, find the redundant backup policies in the **Itemization** tab. Then make adjustments to the **Charged**

**Size** value. Decrement the size by the value of the redundant backup selection and add a comment within the adjacent **Reason** cell.

## Determine affect of multistreamed backups in the capacity licensing report

On the **Itemization** tab, sort the list by **Accuracy Comment**. Find all backups that list **Possible multi-stream backup detected** under **Accuracy Comment** and make note of the policy name under the **Policy Name** column. Then open the log file that was generated when the `nbdeployutil --report` command ran. By default, the log file is in the directory where the gathered report is located.

---

**Note:** If OpsCenter generated the report, the log file is found on the OpsCenter server. The email with the report results contains a link to the log file location. The log file name is in the format `nbdeployutil-report-timestamp-log`.

---

In the log file, find the policy name for the policy in question and look at the corresponding **MAX** value. The excerpt from a log file that is shown highlights the information discussed.

```
Analyzing backups for policy <policy_name>, client <client_name>
Analyzing schedule Full
MAX 2010-09-01 14.6 T (multiple backups )
                21.7 G (client_name_1283295642) 09:00:42
                1.0 T (client_name_1283295643) 09:00:43
                793.1 G (client_name_1283295644) 09:00:45
                1.2 T (client_name_1283295645) 09:00:48
                1.5 T (client_name_1283295647) 09:00:49
```

Confirm this information is correct for the policy. If the information is inaccurate, change the **Charged Size** column, and add a note to the **Enter a Reason here when modifying the Charged Size** column explaining the change.

## Confirm the accuracy of any database backups in the capacity licensing report

You reconcile database backups the same way you reconcile multistream backups. Find the policy name in the spreadsheet and locate the analyzed information in the `nbdeployutil-report-timestamp.log` file. Does the chosen day appear to correspond to a day upon which the complete database was backed up? If the information is inaccurate, change the **Charged Size** column, and add a note to the

**Enter a Reason here when modifying the Charged Size** column explaining the change.

## Locate full backup for snapshot image in the capacity licensing report

Examine the backup policy attributes to determine if a backup image is ever created from the snapshot. If it is, rerun the analyzer with specific options to restrict the collection and reporting to the specific client with a longer date range to find a full backup of the snapshot. If a backup image is never created from the snapshot, manually examine the snapshot or the client system to determine the size of the data.

---

**Note:** The log file that is associated with this report shows snapshot information.

---

DRAFT

# Additional configuration

This chapter includes the following topics:

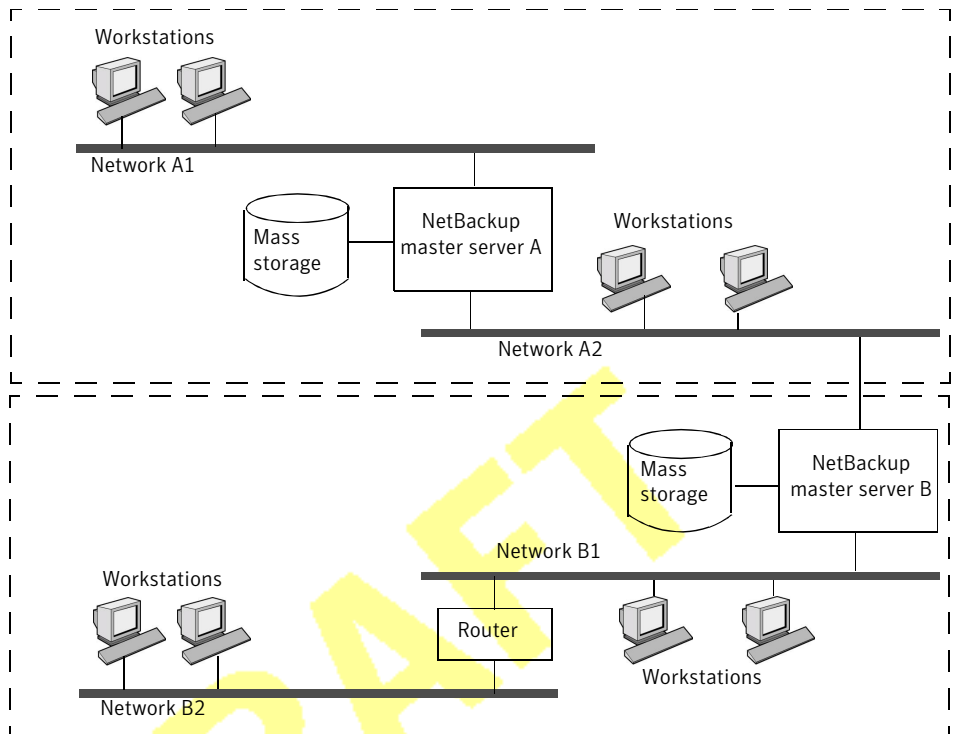

- [About multiple NetBackup master servers](#)
- [About multiple media servers with one master server](#)
- [About direct I/O for backups on Windows](#)
- [About dynamic host name and IP addressing](#)
- [About busy file processing on UNIX clients](#)
- [About specifying the locale of the NetBackup installation](#)
- [Exporting PureDisk data to NetBackup](#)
- [About Shared Storage Option configuration](#)
- [About the `vm.conf` configuration file](#)

## About multiple NetBackup master servers

For a large site, use multiple NetBackup master servers to optimize the backup loads. Divide the clients between the servers as necessary.

[Figure 3-1](#) shows a multiple-server configuration where the two sets of networks (A1/A2 and B1/B2) each have enough clients to justify separate servers.

**Figure 3-1** Multiple master server scenario

In this environment, the two NetBackup server configurations are completely independent. You can also create a configuration where one server is the master and the other is a media server.

## About multiple media servers with one master server

A protection domain refers collectively to the NetBackup master server, its NetBackup media servers, and its NetBackup clients. In a group of NetBackup servers, a client can have backups directed to any device on any server in the group.

Set up a NetBackup protection domain as follows:

- One master server, which controls all backup scheduling.
- Multiple media servers, which write the backup images to disk or removable media. They can have peripheral devices to provide additional storage.
- Multiple protected NetBackup clients, which send their data to the media servers.

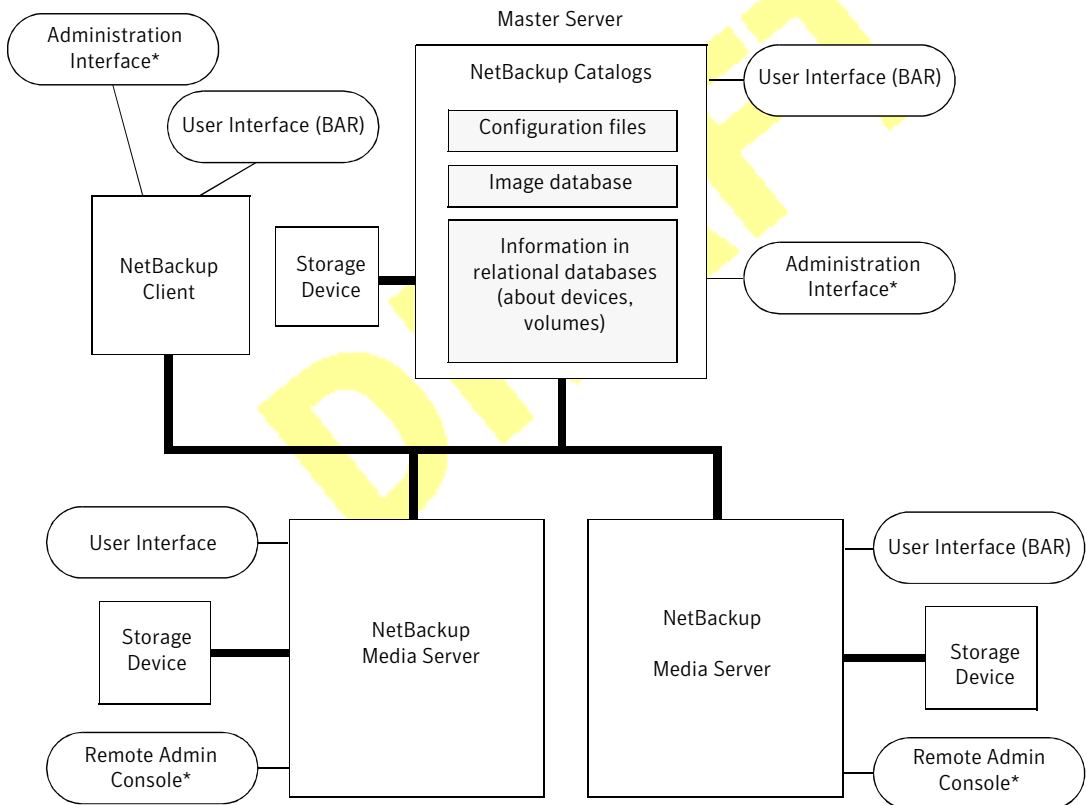

A common alternative strategy is to install extra peripherals on the clients that produce large amounts of data. The master server directs the data from the client to the client's peripherals, which reduces network traffic because the data does not traverse the network. This strategy also distributes the backup load between the master and the media servers.

Important factors to remember about master and media servers are as follows:

- There can be only one master server in a group.
- A NetBackup master server is a media server for itself but cannot be a media server for another master server.

Figure 3-2 shows where software is installed and where the NetBackup catalogs are located (by default).

**Figure 3-2** Catalog location using multiple media servers

\* You can also use the Backup, Archive, and Restore user interface from a Windows client that has the Remote Administration Console installed.

## About software on each server

Install NetBackup server software on each NetBackup server that has a peripheral that you want to include in a storage unit. The NetBackup installation program has choices for master and media server installation.

## About NetBackup catalogs

The master server is the default location for the NetBackup catalogs. The catalogs include the media and the volume database (`emm_data.db`). The volume database contains the media usage information and the volume information that are used during the backups.

## About direct I/O for backups on Windows

By default, the buffer size for disk storage units is 256 KB. If the buffer size is set to a value greater than 256 KB, backups written to that storage unit automatically use direct I/O. An increased buffer size can improve backup speed.

To increase the buffer size, the following conditions must be met:

- The storage unit must be owned by a Windows media server.
- The storage unit must be either a BasicDisk or an Array Disk storage unit.
- The backup to be stored cannot be multiplexed.
- The touch file that disables direct I/O must not be present.

`(install_path\VERITAS\NetBackup\bin\DISABLE_DIRECT_IO)`

To increase the buffer size, create one of the following touch files on the media server that owns the storage unit:

- For backups to disk

```
install_path\VERITAS\NetBackup\db\config\  
SIZE_DATA_BUFFERS_DISK
```

- For backups to disk or tape

```
install_path\VERITAS\NetBackup\db\config\  
SIZE_DATA_BUFFERS
```

If both touch files are present, `SIZE_DATA_BUFFERS_DISK` overrides the value in `SIZE_DATA_BUFFERS`. At this time, Symantec recommends that you use `SIZE_DATA_BUFFERS_DISK`.

Table 3-1 shows the possible values to include in `SIZE_DATA_BUFFERS_DISK` or `SIZE_DATA_BUFFERS ..`

**Table 3-1** Absolute byte values for `SIZE_DATA_BUFFERS_DISK`, `SIZE_DATA_BUFFERS`

For a data buffer of this size (kilobytes),	enter this touch file value
32	32768
64	65536
96	98304
128	131072
160	163840
192	196608
224	229376
256	262144

Data buffer sizes continue in multiples of 32. Multiply the buffer size by 1024 for the touch file value.

A direct I/O backup triggers the following message: "Enabling direct I/O. Buffer size: *<buffer size>*."

## Disabling direct I/O on Windows

Use the following procedure to disable direct I/O.

### To disable direct I/O

- ◆ Create the following touch file on the media server that owns the storage unit:

```
install_path\VERITAS\NetBackup\bin\DISABLE_DIRECT_IO
```

## About dynamic host name and IP addressing

Before making changes to a configuration, read this entire topic.

By default, a NetBackup server assumes that a NetBackup client name is the same as the network host name of the client machine. This assumption makes it difficult to back up any clients that have network host names that might change. For

example, a portable machine that plugs into a LAN and obtains IP addresses from a DHCP server. Or, a remote machine that dials into a PPP server. Use dynamic host name and IP addressing to define NetBackup clients that do not have fixed IP addresses and host names.

If dynamic addressing is used, remember that the NetBackup servers still require fixed IP addresses and host names.

All clients that are configured to use dynamic addressing and host names must trust each other, similar to the NetBackup altnames feature.

The following process is required to support the configurations that use dynamic IP addressing for NetBackup.

**Table 3-2** Process to support the configurations that use dynamic IP addressing for NetBackup

Action	Process details/requirements
Configure the network to use a dynamic IP addressing protocol like DHCP.	<p>NetBackup requires that IP addresses of clients have a network host name.</p> <p>(On Windows) Be sure to define network host names for the range of dynamic IP addresses in the <code>hosts</code> file and (or) DNS on the network.</p> <p>(On UNIX/Linux) Be sure to define network host names for the range of dynamic IP addresses in the <code>hosts</code> file, NIS, and (or) DNS on the network.</p>
Determine the NetBackup client names for the machines that have dynamic IP addresses and network host names.	<p>These NetBackup client names are used in other steps. Each NetBackup client must have a unique NetBackup client name. The NetBackup client name that is assigned to a client is permanent.</p>
Make changes on the master server, as described.	<ul style="list-style-type: none"> <li>■ Create NetBackup policies with client lists that include the new names.</li> <li>■ Create entries in the NetBackup client database for the new client names. Use the <code>bpclient</code> command to create the entries.</li> </ul>
Make changes on each dynamic NetBackup Windows client, as described.	<p>In the <b>NetBackup Administration Console</b>, in the left pane, click <b>NetBackup Management</b>. On the <b>File</b> menu, click <b>Backup, Archive, and Restore</b>. On the <b>File</b> menu, click <b>NetBackup Client Properties</b>. In the <b>NetBackup Client Properties</b> dialog box, select the <b>General</b> tab. Enter the correct NetBackup client name for the machine in the <b>Client Name</b> text box.</p>

**Table 3-2** Process to support the configurations that use dynamic IP addressing for NetBackup (*continued*)

Action	Process details/requirements
On the master server, enable the <b>Announce DHCP Interval</b> option, as described.	In the <b>NetBackup Administration Console</b> , in the left pane, expand <b>NetBackup Management &gt; Host Properties &gt; Clients</b> . Double-click on the the Windows client(s) in the right pane to open the <b>Client Properties</b> window. In the <b>Client Properties</b> window, in the left pane, expand <b>Windows Client &gt; Network</b> . In the right pane, check the <b>Announce DHCP Interval</b> checkbox.
Make changes on each dynamic NetBackup UNIX clients, as described.	<ul style="list-style-type: none"> <li>■ Modify the <code>bp.conf</code> file to include a <code>CLIENT_NAME</code> entry with the correct NetBackup client name for the machine.</li> <li>■ Configure the system to notify the master server of the machine's NetBackup client name and current network host name during startup. The <code>bpdynamicclient</code> command is used to notify the master server.</li> <li>■ Configure the system to notify periodically the master server of the machine's NetBackup client name and current network host name.</li> </ul>

## About setting up dynamic IP addresses and host names

Configure the network to use a dynamic IP addressing protocol. A protocol like DHCP has a server and several clients. For example, when a DHCP client starts up, it requests an IP address from the DHCP server. The server then assigns an IP address to the client from a range of predefined addresses.

NetBackup requires that the IP addresses of NetBackup clients have corresponding network host names. Ensure that each IP address that can be assigned to NetBackup clients has a network host name. The host name should be defined in the host file, NIS, and DNS on the network.

For example, 10 dynamic IP addresses and host names are available.

The dynamic IP addresses and host names might be as follows:

```
123.123.123.70 dynamic00
123.123.123.71 dynamic01
123.123.123.72 dynamic02
123.123.123.73 dynamic03
.
.
.
123.123.123.79 dynamic09
```

Assign a unique NetBackup client name to each NetBackup client that might use one of these dynamic IP addresses. The NetBackup client name that is assigned to a client is permanent and should not be changed. The client name that is assigned to NetBackup clients with dynamic IP addressing must not be the same as any network host names on the network. If the NetBackup client names are changed or are not unique, backup and restore results are unpredictable.

For example, 20 machines share the IP addresses as previously defined.

To make these machines NetBackup clients, assign them the following NetBackup client names:

```
nbclient01
nbclient02
nbclient03
nbclient04
.
.
.
nbclient20
```

## Configuring the NetBackup master server

Use the following procedure to configure the NetBackup master server.

### To configure the NetBackup master server

- 1 On the master server, create the NetBackup backup policies. For client name lists, use the NetBackup client names (for example, *nbclient01*) rather than the dynamic network host names (for example, *dynamic01*).
- 2 Create the client database on the master server.

The client database consists of directories and files in the following directory:

On Windows:

```
install_path\NetBackup\db\client
```

On UNIX/Linux:

```
/usr/opensv/netbackup/db/client
```

### 3 Create, update, list, and delete client entries with the `bpclient` command.

The `bpclient` command is in the following directory:

On Windows:

```
install_path\NetBackup\bin\admincmd
```

On UNIX/Linux:

```
/usr/opensv/netbackup/bin/admincmd
```

See [“bpclient commands that control client entries”](#) on page 48.

In the example, enter the following commands to create the 20 clients:

On Windows:

```
cd install_path\NetBackup\bin\admincmd
```

On UNIX/Linux:

```
cd /usr/opensv/netbackup/bin/admincmd
bpclient -add -client nbclient01 -dynamic_address 1
bpclient -add -client nbclient02 -dynamic_address 1
bpclient -add -client nbclient03 -dynamic_address 1
bpclient -add -client nbclient04 -dynamic_address 1
.
.
.
bpclient -add -client nbclient20 -dynamic_address 1
```

- 4 To see what is currently in the client database, run `bpclient` as follows:

On Windows:

```
install_path\NetBackup\bin\admincmd\bpclient -L -All
```

On UNIX/Linux:

```
/usr/openv/netbackup/bin/admincmd/bpclient -L -All
```

The output is similar to the following:

```
Client Name: nbclient01
Current Host:
Hostname: *NULL*
IP Address: 0.0.0.0
Connect on non-reserved port: no
Dynamic Address: yes

Client Name: nbclient02
Current Host:
Hostname: *NULL*
IP Address: 0.0.0.0
Connect on non-reserved port: no
Dynamic Address: yes
.
.
.
Client Name: nbclient20
Current Host:
Hostname: *NULL*
IP Address: 0.0.0.0
Connect on non-reserved port: no
Dynamic Address: yes
```

The NetBackup client notifies the NetBackup server of its NetBackup client name and network host name. Then the Current Host, Hostname, and IP address fields display the values for that NetBackup client.

## bpclient commands that control client entries

The `bpclient` command creates, updates, lists, and deletes client entries. The following table shows the `bpclient` commands that control client entries.

**Table 3-3** bpclient commands that control client entries

Action	Command
Create a dynamic client entry	<p>On Windows:</p> <pre>bpclient.exe -add -client <i>client_name</i> -dynamic_address 1</pre> <p>On UNIX/Linux:</p> <pre>bpclient -add -client <i>client_name</i> -dynamic_address 1</pre> <p>Where <i>client_name</i> is the NetBackup client name. The -dynamic_address 1 argument indicates that the client uses dynamic IP addressing. It is possible to create entries with -dynamic_address 0 for static IP addressing. However, to do so is unnecessary and adversely affects performance.</p>
Delete a client entry	<p>On Windows:</p> <pre>bpclient.exe -delete -client <i>client_name</i></pre> <p>On UNIX/Linux:</p> <pre>bpclient -delete -client <i>client_name</i></pre>
List a client entry	<p>On Windows:</p> <pre>bpclient.exe -L -client <i>client_name</i></pre> <p>On UNIX/Linux:</p> <pre>bpclient -L -client <i>client_name</i></pre>
List all client entries	<p>On Windows:</p> <pre>bpclient.exe -L -All</pre> <p>On UNIX/Linux:</p> <pre>bpclient -L -All</pre>

## Configuring a dynamic Windows client

Use the following procedure to configure a dynamic Windows client.

#### To configure a dynamic Windows client

- 1 If it is not already installed, install NetBackup on the Windows client.
- 2 In the **NetBackup Administration Console**, in the left pane, click **NetBackup Management**. On the menu bar, expand **File > Backup, Archive, and Restore**.
- 3 On the menu bar of the **Backup, Archive, and Restore** dialog box, expand **File > NetBackup Client Properties**.
- 4 In the **NetBackup Client Properties** dialog box, select the **General** tab. Change the **Client Name** to specify the NetBackup client name for the Windows client. Click **OK**.
- 5 In the **NetBackup Administration Console**, set **Announce DHCP Interval**. This value specifies how many minutes the client waits before it announces that it will use a different IP address.

To set the **Announce DHCP Interval**, return to the **NetBackup Administration Console**. In the left pane, expand **NetBackup Management > Host Properties > Clients**. Double-click on the the Windows client(s) in the right pane to open the **Client Properties** window. In the **Client Properties** window, in the left pane, expand **Windows Client > Network**. In the right pane, check the **Announce DHCP Interval** checkbox.

Additional information is available for **Announce DHCP Interval** in the *Administrator's Guide, Volume I*.

The server is not notified if the default value of 0 is used. For a DHCP client, a good value to use is one-half of the lease period.

- 6 On the client, stop and restart the NetBackup Client service to have the changes take effect.

## Configuring a dynamic UNIX NetBackup client

Use the following procedure to configure a dynamic UNIX NetBackup client.

#### To configure a dynamic UNIX NetBackup client

- 1 If not already installed, install the NetBackup client software.
- 2 Edit the `/usr/opensv/netbackup/bp.conf` file. Use the `CLIENT_NAME` entry to specify the NetBackup client name for the machine, as follows:

```
CLIENT_NAME = nbclient00
```

- 3 Run the `bpdynamicclient` command once when the system first starts up. `bpdynamicclient` notifies the NetBackup server of the machine's NetBackup client name and current network host name. The `bpdynamicclient` command is in the directory:

```
/usr/opensv/netbackup/bin
```

The format of the `bpdynamicclient` command is as follows:

```
bpdynamicclient -last_successful_hostname file_name
```

When `bpdynamicclient` starts up, it checks for the existence of *file\_name*. If *file\_name* exists, `bpdynamicclient` determines if the host name that is written in the file is the same as the current network host name. If the host names match, `bpdynamicclient` exits and does not connect to the master server. If the host names do not match, `bpdynamicclient` connects to the master server and informs the server of its NetBackup client name and host name. If `bpdynamicclient` successfully informs the server, `bpdynamicclient` writes the current network host name into *file\_name*. If `bpdynamicclient` cannot inform the server, `bpdynamicclient` deletes *file\_name*.

Most UNIX systems provide a facility to define startup scripts.

For example, create the following script in the `/etc/rc2.d` directory on a Solaris system:

```
# cat > /etc/rc2.d/S99nbdynamicclient <<EOF
#!/bin/sh

rm /usr/opensv/netbackup/last_successful_hostname
/usr/opensv/netbackup/bin/bpdynamicclient
-last_successful_hostname \
/usr/opensv/netbackup/last_successful_hostname
EOF
# chmod 544 /etc/rc2.d/S99nbdynamicclient
```

Ensure that the dynamic client startup script is called after the machine obtains its IP address.

- 4 You must also create a root `crontab` entry to call the `bpdynamicclient` command periodically.

For example, the following entry (one line) calls `bpdynamicclient` at seven minutes after each hour:

```
7 * * * * /usr/opensv/netbackup/bin/bpdynamicclient
-last_successful_hostname
/usr/opensv/netbackup/last_successful_hostname
```

For DHCP, an acceptable interval to use between calls to `bpdynamicclient` is one-half of the lease period.

## About busy file processing on UNIX clients

Busy file processing applies only to UNIX clients.

Information about VSP (Volume Snapshot Provider) is available for Windows clients.

See the *NetBackup Administrator's Guide, Volume I*.

A busy file is a file that was detected as changed during a user or a scheduled backup. Typically, detection occurs if a process writes to a file while NetBackup attempts to back it up.

The following conditions result in the detection of busy files:

- Read error on the file
- File modification time changed
- File inode time changed
- File size changed

The backup usually completes with a status of 1, which indicates that the backup was partially successful. Busy file processing allows the user control the actions of NetBackup when busy files are detected.

Busy file processing can be configured in the **Busy File Settings** host properties for UNIX clients.

See the *NetBackup Administrator's Guide, Volume I*.

Busy file processing can also be enabled by adding the `BUSY_FILE_PROCESSING` option to the client `/usr/opensv/netbackup/bp.conf` file. Then add other busy file options to control the processing of busy files. The options can exist in both the client `/usr/opensv/netbackup/bp.conf` file and a user's `$HOME/bp.conf`. The user's `bp.conf` file takes precedence when the options are in both places.

NetBackup creates several files and directories when processing busy files. Initially, a working directory named `busy_files` is created under `/usr/opensv/netbackup`. NetBackup then creates the `/actions` directory under `busy_files` and places action files in that directory. An action file contains the information that NetBackup uses to control the processing of busy files.

By default, the contents of the action file are derived from the `BUSY_FILE_ACTION` options in `bp.conf`. A user can also create an action file to control a specific backup policy and schedule. NetBackup creates a logs directory under `busy_files` for storing busy file status and diagnostic information.

## Configuring busy file processing on UNIX

Use the following procedure to use the `bp.conf` file to configure busy file processing.

### To configure busy file processing

- 1 Modify the `bp.conf` file options.  
See [“Modifying bp.conf to configure busy file processing on UNIX”](#) on page 54.
- 2 Copy the `bpend_notify_busy` script, located on the master server:

```
/usr/opensv/netbackup/bin/goodies/bpend_notify_busy
```

to the following path on the client:

```
/usr/opensv/netbackup/bin/bpend_notify
```

Be sure to set the file access permissions to allow groups and others to run `bpend_notify`.

(This step is also performed when configuring busy file processing in the **Busy File Settings** host properties.)

- 3 Configure a policy with a user backup schedule for the busy file backups.  
This policy services the backup requests that the `repeat` option in the actions file generates. The policy name is significant. By default, NetBackup alphabetically searches (upper-case characters first) for the first available policy with a user backup schedule and an open backup window. For example, a policy name of `AAA_busy_files` is selected ahead of `B_policy`.

(This step is also performed when configuring busy file processing in the **Busy File Settings** host properties.)

## Modifying bp.conf to configure busy file processing on UNIX

Use the following procedure to modify the `bp.conf` file to configure busy file processing.

**To modify the `bp.conf` file to configure busy file processing**

- 1 Configure busy file processing by using the **Busy File Settings** host properties for UNIX clients.

See the *NetBackup Administrator's Guide, Volume I*.

- 2 Or, configure busy file processing by using the entries in the `bp.conf` file on the client. The user can also configure a `bp.conf` file in a home directory. The busy file options that are specified in the user's `bp.conf` file apply only to user-directed backups. NetBackup ignores busy file processing for user backups if a `bp.conf` file does not exist in their home directory.

The `bp.conf` file entries to use are as follows:

- `BUSY_FILE_PROCESSING`
- `BUSY_FILE_DIRECTORY`
- `BUSY_FILE_ACTION`

## bp.conf file entries on UNIX

The following table describes the `bp.conf` file entries that are used to configure busy file processing.

**Table 3-4** `bp.conf` file entries

Entry	Description
<code>BUSY_FILE_PROCESSING</code>	Enables the NetBackup busy file-processing feature. By default, this entry is not present in the client's <code>/usr/opensv/netbackup/bp.conf</code> file.
<code>BUSY_FILE_DIRECTORY</code>	Specifies an alternate path to the busy files working directory. This entry is not required. By default, this entry is not present in the client's <code>/usr/opensv/netbackup/bp.conf</code> or <code>\$HOME/bp.conf</code> file. By default, NetBackup creates the <code>busy_files</code> directory in <code>/usr/opensv/netbackup</code> or the user's home directory.

**Table 3-4** bp.conf file entries (*continued*)

Entry	Description
BUSY_FILE_ACTION	<p>Directs the action that NetBackup performs on busy files. By default, this entry is not present in the client's <code>/usr/opensv/netbackup/bp.conf</code> or <code>\$HOME/bp.conf</code> file.</p> <p>Multiple entries may exist in the following form:</p> <pre>BUSY_FILE_ACTION = filename_template action_template</pre> <p>Where</p> <ul style="list-style-type: none"> <li>■ <i>filename_template</i> is the absolute pathname and file name of the busy file. The shell language metacharacters <code>*</code>, <code>?</code>, <code>[]</code>, <code>[-]</code> can be used to match the patterns of file names or parts of file names.</li> <li>■ <i>action_template</i> is one of the following: <pre>MAIL   mail</pre> <p>Directs NetBackup to mail a busy file notification message to the user that the <code>BUSY_FILE_NOTIFY_USER</code> option specifies.</p> <pre>REPEAT   repeat [repeat_count]</pre> <p>Directs NetBackup to retry the backup on the specified busy file. A repeat count can be specified to control the number of backup attempts. The default repeat count is 1.</p> <pre>IGNORE   ignore</pre> <p>Directs NetBackup to exclude the busy file from busy file processing. The file is backed up and a log entry that indicates that the file was busy appears in the All Log Entries report.</p> <pre>BUSY_FILE_NOTIFY_USER</pre> <p>Specifies the recipient of the busy file notification message when <code>BUSY_FILE_ACTION</code> is set to <code>MAIL</code> or <code>mail</code>. By default, <code>BUSY_FILE_NOTIFY_USER</code> is not in <code>/usr/opensv/netbackup/bp.conf</code> or <code>\$HOME/bp.conf</code> file on a client. By default, the mail recipient is root. See <a href="#">Table 3-5</a> on page 56.</p> </li> </ul>

The following table shows examples of how a `BUSY_FILE_ACTION` entry works.

Table 3-5 Examples of how a BUSY\_FILE\_ACTION entry works

Example	Description
<pre>BUSY_FILE_PROCESSING BUSY_FILE_DIRECTORY = /tmp BUSY_FILE_NOTIFY_USER = kwc BUSY_FILE_ACTION = /usr/* mail BUSY_FILE_ACTION = /usr/local ignore</pre>	<p>This example causes NetBackup to take the following actions when it encounters busy files:</p> <ul style="list-style-type: none"><li>■ Create the busy files working directory in /tmp</li><li>■ Send an email notification message to user kwc for all busy files that it finds under /usr except for those in /usr/local.</li></ul>
<pre>BUSY_FILE_PROCESSING BUSY_FILE_ACTION = /usr/* repeat 2 BUSY_FILE_ACTION = /usr/openv mail BUSY_FILE_ACTION = /usr/local ignore</pre>	<p>This example causes NetBackup to take the following actions when it encounters busy files:</p> <ul style="list-style-type: none"><li>■ Send a busy file notification message to root for busy files in /usr/openv.</li><li>■ Repeat the backup up to two times for all busy files that it finds under /usr, except for those in /usr/openv and /usr/local.</li><li>■ Exclude the busy files in /usr/local from all actions.</li></ul>

## How NetBackup creates and uses action files on UNIX

When a backup operation begins, NetBackup creates a default action file named `actions` in the `busy_files/actions` directory. The contents of the `actions` file are derived from the `BUSY_FILE_ACTION` options in the `bp.conf` file.

Normally, NetBackup refers to the default action file for all future busy file processing. To override the default, create an action file to control a specific backup policy and schedule. The following entries show the naming convention for the policy and the schedule action files:

```
actions.policy_name.schedule_name
actions.policy_name
```

Where *policy\_name* and *schedule\_name* correspond to a predefined backup policy and schedule.

NetBackup performs the following steps when it searches for an action file.

**Table 3-6** NetBackup steps when it searches for an action file

Step	Example
Checks for a file that names a specific policy and schedule, such as:	<code>actions.policy_name.schedule_name</code>
If a file for a specific policy and schedule is not found, NetBackup searches for a less specific name, such as the following:	<code>actionpolicy_names</code>
<p>If a less specific name does not exist, NetBackup refers to the default action file.</p> <p>The contents of user-created action files are similar to the default. Optional comment lines can be included. The specification is the same as for the <code>BUSY_FILE_ACTION</code> option:</p>	<pre># comment_line filename_template action_template</pre> <p><b>Example 1:</b></p> <p>The <code>bp.conf</code> file might contain the following:</p> <pre>BUSY_FILE_ACTION =     /usr/openv mail BUSY_FILE_ACTION = /usr/* repeat 2 BUSY_FILE_ACTION = /usr/local ignore</pre> <p>If yes, the default actions file (named <code>actions</code>) contains the following lines:</p> <pre>/usr/openv mail /usr/* repeat 2 /usr/local ignore</pre> <p><b>Example 2:</b></p> <p>An action file name for a backup policy <code>production_servers</code> with a schedule name <code>full</code> follows:</p> <pre>actions.production_servers.full</pre> <p>The <code>actions</code> file can contain the following line:</p> <pre>/bin/* repeat</pre> <p>If yes, NetBackup repeats the backup for busy files in the <code>/bin</code> directory.</p>

## About the logs directory on UNIX

During busy file processing NetBackup creates a number of files under the `busy_files/logs` directory. These files contain status and diagnostic information. NetBackup derives the names of these files from the policy name, schedule name, and process ID (PID) of the backup.

NetBackup creates the following logs:

- **Busy file log**

NetBackup records the names of any busy files in the busy file log. The name of the busy file log has the following form:

*policy\_name.schedule\_name.PID*

- **Diagnostic log file**

NetBackup generates a log file that contains diagnostic information. The name of the log file has the following form:

*log.policy\_name.schedule\_name.PID*

- **Retry log file**

NetBackup also generates a **retry file** that contains diagnostic information that is recorded when the **repeat option** is specified. The name of the retry file has the following form:

*policy\_name.schedule\_name.PID.retry.retry\_count*

Where *retry\_count* starts at zero and increases by one every time a backup is repeated. Processing stops when *retry\_count* is one less than the number that is specified by the **repeat** option.

Example:

To service **busy** file backup requests, the administrator defined a policy named `AAA_busy_files` that has a user backup schedule named `user`. A scheduled backup is initiated with the policy named `production_servers`, schedule named `full`, and PID of 1442.

If busy files are detected, NetBackup generates the following files in the `/usr/openv/netbackup/busy_files/logs` directory:

```
production_servers.full.1442
log.production_servers.full.1442
```

If the actions file has the repeat count set to 2, NetBackup generates the following files:

```
production_servers.full.1442.retry.0
AAA_busy_files.user.10639
log.AAA_busy_files.user.10639
```

If a repeat backup is attempted, NetBackup generates the following files:

```
production_servers.full.1442.retry.1
AAA_busy_files.user.15639
log.AAA_busy_files.user.15639
```

## Recommended changes for modifying bpend\_notify\_busy on UNIX

The administrator can modify busy file processing by changing the `bpend_notify_busy` script.

The only recommended changes are as follows:

- Changing the `RETRY_POLICY` and `RETRY_SCHED` variables from `NONE` to the busy file backup policy name and schedule name.
- Remove the files in the logs directory after busy file processing (these logs are not removed automatically):
  - At the end of the `busy_files()` function, add the following command:

```
/bin/rm -f $LOG_FILE
```

- After the call to the `busy_files()` function in main, add the following commands:

```
/bin/rm -f $BUSYFILELOG
/bin/rm -f $RETRY_FILE
```

## About specifying the locale of the NetBackup installation

NetBackup applications can display a wide range of international date and time formats as determined by the locale of the installation. To help ensure consistency among the applications, NetBackup uses a single, configurable source to define the locale conventions.

The `install_path\VERITAS\msg\LC.CONF` file (on Windows) and the `/user/openv/msg/.conf` file (on UNIX/Linux) contain information on the supported locales. These files define the date and the time formats for each

supported locale. The `.conf` file and the `LC.CONF` file contain very specific instructions on how to add or modify the list of supported locales and formats.

The `.conf` file and the `LC.CONF` file are divided into two parts, the TL lines and the TM lines:

#### ■ TL Lines

The third field of the TL lines defines the case-sensitive locales that the NetBackup applications support. The fourth and the fifth fields define the date and the time fields and associated separators for that supported locale.

Modify the existing formats to change the default output.

For example, the TL line for the C locale is the following:

```
TL 1 C :hh:mn:ss/mm/dd/yyyy
```

An alternate specification to the order of months, days, and years is as follows:

```
TL 1 C :hh:mn:ss -yyyy-mm-dd
```

Or:

```
TL 1 C :hh:mn:ss/dd/mm/yy
```

To add more TL lines, see the comments in the `.conf` file.

If the `.conf` file is not accessible, the default locales (TL lines) are:

```
TL 1 C :hh:mn:ss /mm/dd/yyyy
```

```
TL 2 ov :hh:mn:ss/mm/dd/yyyy
```

Note that `C` and `ov` are synonymous.

#### ■ TM Lines

The TM lines define a mapping from unrecognized locales to those supported by NetBackup, as defined by the TL lines.

The third field of the TM lines defines the unrecognized locale. The fifth field defines the supported equivalent that is identified in the TL lines.

For example, use the following TM line to map the unrecognized locale French to the supported locale fr, the TM line is:

```
TM 6 french 2 fr
```

To map French to C

```
TM 6 french 1 C
```

To add more TM lines, see the specific instructions in the `.conf` file.

If the `.conf` file is not accessible, no default TM lines exist as the default locale is C (ov).

## Exporting PureDisk data to NetBackup

NetBackup allows the export of PureDisk backups of Files and Folders data selections to NetBackup. NetBackup then can create copies of the data in NetBackup file format on NetBackup-supported media for possible disaster recovery purposes.

### Required software and licenses

The PureDisk export capability is supported jointly by NetBackup and PureDisk.

- PureDisk requires release 6.1 MP1 or later.  
For more information about software versions and licensing, see the *PureDisk Administrator's Guide*.
- The NetBackup DataStore license is required to provide the DataStore policy type selection.

### Exporting PureDisk data

To export PureDisk backup data to NetBackup requires the creation of the following two active policies:

- An **Export to NetBackup** policy in PureDisk.  
For information about creating an export policy, see the *NetBackup PureDisk Remote Office Edition Administrator's Guide*
- A DataStore type policy in NetBackup.  
See [“Creating a NetBackup policy for a PureDisk backup data export”](#) on page 61.

The policies can be created in any order. The export takes place when the PureDisk policy runs.

Standard debugging techniques apply to both PureDisk and NetBackup. The VxBSA debug log is written to the `pdexport` directory.

### Creating a NetBackup policy for a PureDisk backup data export

Use the following procedure to create a DataStore type policy for a PureDisk backup data export.

**To configure a NetBackup policy for a PureDisk backup data export**

- 1** Open the **NetBackup Administration Console**.
- 2** Select the master server that controls the media server to perform the export.
- 3** Select the **Policies** utility, then **Actions > New > New Policy**.
- 4** Enter a name for the policy. This name is entered in the **Parameters** tab in the PureDisk export policy.
- 5** Complete the following tabs in the **Add New Policy** dialog box:

■ **Attributes** tab

Select DataStore as the policy type. (The DataStore policy type selection appears if the DataStore license key is installed.) The compression and multiple data streams attributes are not supported for export because they are not supported upon restore. To run multiple streams, multiple export agents are required.

■ **Schedules** tab

By default, a DataStore policy type uses an Application Backup schedule. The start window for an Application Backup type is open every day for 24 hours.

You can adjust the default schedule or create a new schedule, but the start windows must coincide with the PureDisk Export policy start window.

■ **Clients** tab

In the **Clients** tab, add the name of the PureDisk export agent(s). (Multiple PureDisk export agents can indicate the same NetBackup DataStore policy. Add the export agents in the **Clients** tab as needed.) Do not include the name of the originating PureDisk clients.

■ **Backup Selections** tab

No entries are required on the **Backup Selections** tab.

- 6** Save and close the policy.

See [“Exporting PureDisk data”](#) on page 61.

## Restoring PureDisk export data

Use the NetBackup client interface, **Backup, Archive, and Restore**, to restore the PureDisk export data to a PureDisk export agent. The system to which the data selections are restored must contain the NetBackup client software and the NetBackup engineering binary to support the export engine.

After the data is restored to the export agent, use a network transfer method to move the files to individual PureDisk clients.

### To restore PureDisk export data

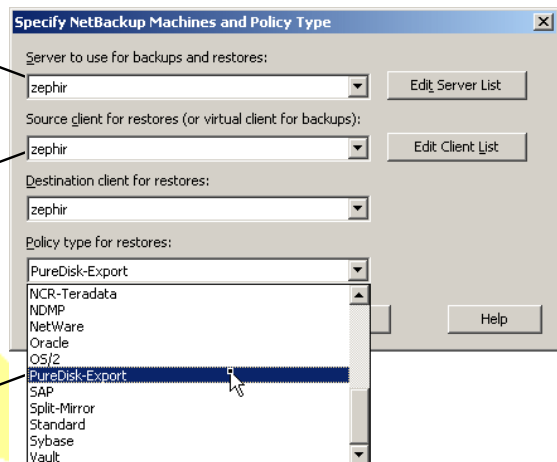

- 1 Open the NetBackup **Backup, Archive, and Restore** interface on the export agent.
- 2 Select **File > Specify NetBackup Machines and Policy Types**.
- 3 In the **Specify NetBackup Machines and Policy Types** dialog box, select the PureDisk-Export policy type to display the export data available for restore.

Although the NetBackup job runs as a DataStore policy type, the job is cataloged as a PureDisk-Export policy type under the name of the PureDisk agent.

Select the NetBackup server where the PureDisk backup data was exported to.

Select the PureDisk agent where the data was exported from. To restore the data, the agent must contain NetBackup client software.

Select PureDisk-Export as the policy type

- 4 Select a backup to restore from the NetBackup History.
- 5 Restore the files to the selected client as you would restore from a user-directed backup.

### About restore support

NetBackup can restore only what PureDisk supports as part of its backups. For example, PureDisk does not provide access control list (ACL) support beyond UNIX file or directory permissions, so NetBackup cannot restore ACLs. See the PureDisk documentation for complete details.

Additional comments on restores includes the following:

- While Windows and UNIX security information can be restored, one limitation exists regarding restores to an alternate client for UNIX files.

NetBackup backs up both the user ID and user name, but PureDisk backs up only the user ID. In non-PureDisk export backups during a restore to an alternate client, a user name can map to a different user ID. NetBackup performs a search for the user name and changes the user ID appropriately. For PureDisk export backups this ability is lost since the user name is not available. Files that are restored can belong to a different user.

- Windows files can be restored to UNIX systems and UNIX files can be restored to Windows systems. However, security information is lost when Windows files are restored to UNIX.

## About Shared Storage Option configuration

The Shared Storage Option allows multiple NetBackup media servers to share individual tape drives (standalone drives or drives in a robotic library). NetBackup automatically allocates and unallocates the drives as backup and restore operations require.

The Shared Storage Option is a separately licensed and a separately purchased NetBackup software option that allows tape drive sharing. The license key is the Shared Storage Option key.

The Shared Storage Option is required only if multiple hosts share drives. For example, multiple NDMP hosts may share one or more drives.

The Shared Storage Option requires appropriate hardware connectivity, such as Fibre Channel hubs or switches, SCSI multiplexors, or SCSI-to-fibre bridges.

You can use Shared Storage Option in the following environments:

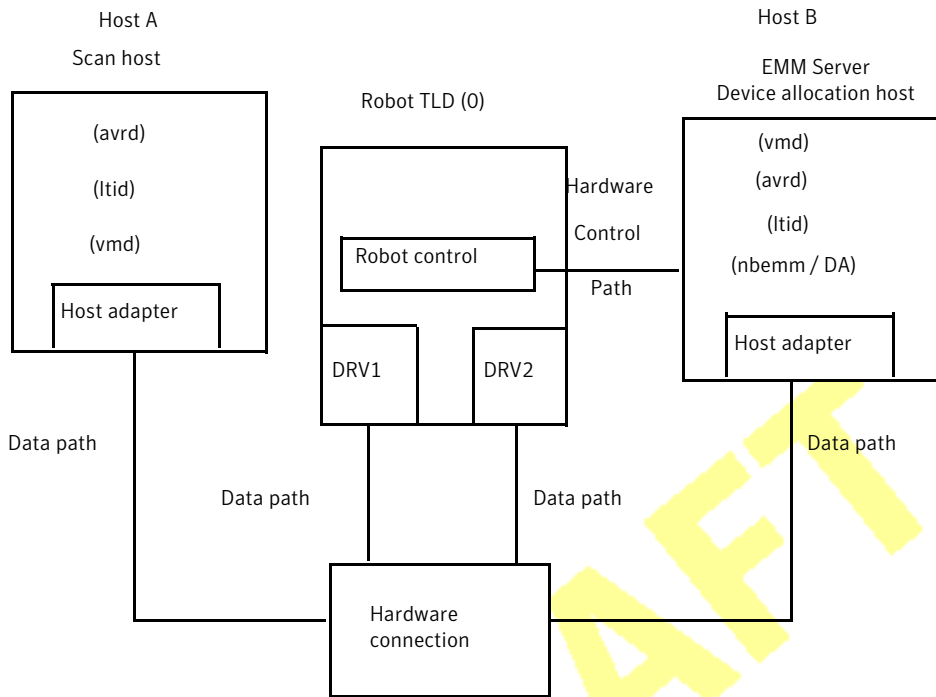

- Fibre Channel SANs
- Environments that do not use Fibre Channel, such as SCSI switches or multi-initiator configurations

## About Shared Storage Option components

The NetBackup Enterprise Media Manager (EMM) manages media information. The Enterprise Media Manager also is the device allocator (DA) for shared drives.

Figure 3-3 shows an example of a shared drive configuration.

**Figure 3-3** Shared Storage Option example

In this figure, the following describes Host A:

- It is connected to drives DRV1 and DRV2 through SAN hardware.
- Host A is the first host in the environment to come online with a non-zero scan ability factor. Therefore, it is the initial scan host for its drives. See [“About scan hosts”](#) on page 66.

In this figure, the following describes Host B:

- It is connected to drives DRV1 and DRV2 through SAN hardware.
- It is configured to be the EMM server, which is also the device allocation host. See [“About the device allocation host”](#) on page 68.
- It controls the robotics. Except for ACS or TLM robot types, only one robot control host exists for each robot.
- It can be configured (optionally) as a highly available (HA) server.

For a process flow diagram of Shared Storage Option components, see the *NetBackup Troubleshooting Guide*.

## About SAN media servers

SAN media servers are NetBackup media servers that back up their own data. SAN media servers cannot back up the data that resides on other clients.

SAN media servers are useful for certain situations. For example, a SAN media server is useful if the data volume consumes so much network bandwidth that it affects your network negatively.

When you define a backup policy for a SAN media server, add only the SAN media server as the client.

The NetBackup Shared Storage Option can use NetBackup SAN media servers.

## About SSO and the NetBackup EMM server

To coordinate network-wide allocation of tape drives, the NetBackup Enterprise Media Manager (EMM) manages all shared tape requests in a SAN. EMM responds to requests from multiple instances of NetBackup master servers, media servers, and NetBackup SAN media servers.

For shared drive configurations, the host that is configured as the EMM server is also known as the device allocation host.

See [“About the device allocation host”](#) on page 68.

EMM maintains shared drive and host information. Information includes a list of hosts that are online and available to share a drive and which host currently has the drive reserved. The Media Manager device service (ltd) requests shared drive information changes.

## About scan hosts

Scan hosts are a component of the NetBackup Shared Storage Option.

Each shared drive has a host that is identified as the scan host. A scan host is the host from which the automatic volume recognition process (avrd) scans unassigned drives. (The robotic daemons scan assigned drives.) A scan host must have data path access to the drive.

The EMM database contains the shared drive information; that information includes the scan host. Media servers receive drive status information from the EMM server.

How the scan host is determined	<p>EMM determines scan hosts; a scan host may be different for each shared drive. The first host in the environment to come online with a non-zero scan ability factor is the initial scan host for its drives.</p> <p>To configure the scan ability factor of media servers, use the <code>nbemmcmd</code> command. For more information, see <i>NetBackup Commands Reference Guide</i>.)</p>
The scan host can change	<p>A scan host is assigned for a shared drive until some interruption occurs.</p> <p>For example, if one of the following occurs, EMM chooses a new scan host:</p> <ul style="list-style-type: none"> <li>■ The socket connection, the host, the drive, the drive path, or the network goes down.</li> <li>■ The drive is logically placed in the Down mode.</li> </ul> <p>The scan host temporarily changes to hosts that request tape mounts while the mount is in progress. Scan host changes occur so only one host at a time has access to the drive path.</p>
Drive paths for the scan host	<p>If a drive has multiple paths that are configured on the selected scan host, EMM selects a scan path as follows:</p> <ul style="list-style-type: none"> <li>■ The first local device path it finds in its database in the UP state.</li> <li>■ The first NDMP-attached drive path it finds in its database in the UP state.</li> </ul>

#### Shared tape drive polling

For shared tape drives, only the scan host polls drives until a mount request is received from NetBackup. During a mount request, NetBackup uses the host that requests the mount to poll the shared drive.

This design enables NetBackup to support Dynamic Loop Switching or SAN zones. Each tape drive needs to be detected only from a single host. Each tape drive can potentially have its own scan host that switches dynamically to process errors and continue availability. A central device arbitrating component manages scan host assignments for shared drives. The arbitrating component also provides a network drive reservation system so that multiple NetBackup media servers can share a drive.

Polling a shared tape drive allows dynamic loop switching and reduces the number of device accesses and reduces CPU time. However, it cannot detect connectivity breaks (for example, discontinuity in the Fibre Channel fabric) until I/O occurs.

### About the device allocation host

The device allocation host is another name for the EMM server, when the EMM server performs device allocation tasks for Shared Storage Option.

## About reserving or releasing shared devices

The Shared Storage Option does not load firmware in SAN devices or communicate with hub or switch APIs. The Shared Storage Option can communicate with hub or switch APIs if you use the NetBackup `shared_drive_notify` script.

NetBackup runs the `shared_drive_notify` script when a shared drive is reserved or released.

The script requires the following parameters:

- The name of the shared drive.
- The name of the current scan host.
- The operation, which is one of the following:

RESERVED	The host on which the script is executed needs SCSI access to the drive until it is released.
ASSIGNED	Informational only. It does not change the fact that the host that reserved the drive needs SCSI access.

RELEASED	Only the scan host needs SCSI access to the drive.
SCANHOST	The host that executes the script has become the scan host. A host should not become a scan host while the drive is RESERVED.  The scan host may change between a RESERVED operation and a RELEASED operation.

The script resides in the following directory:

On Windows: *Install\_path*\VERITAS\Volmgr\bin

On UNIX/Linux: /usr/opensv/volmgr/bin/shared\_drive\_notify

---

**Note:** The script must be executable by the root user.

---

The script exits with status 0 upon successful completion.

## How to share robotic libraries without using the Shared Storage Option

You can share robotic tape libraries among multiple NetBackup media servers by using any of the following methods:

- **Shared library support**  
NetBackup allows different drives within the same robotic library to be configured on different media servers. This capability is termed shared library support. Robot types that support shared library are ACS, TL8, TLD, TLH, TLM.
- **Partitioned libraries**  
Some robot vendors also let you partition libraries. One partitioned view of the robotic library includes one set of drives, while the other view has a different set of drives in the library. Partitions let two robotic control daemons on different control hosts manage the robotic library – possibly each for a different NetBackup master and media server environment.
- **Multiple master servers**  
Use multiple NetBackup master servers that share a common media and device management domain. This means that the master servers use the same EMM server.

These capabilities are not related to Shared Storage Option and should not be confused with Shared Storage Option.

## Shared Storage Option terms and concepts

[Table 3-7](#) describes the terms and the concepts relevant to understanding the Shared Storage Option.

**Table 3-7** Shared Storage Option terms and concepts

Term	Definition
Backup Exec Shared Storage Option	The NetBackup Shared Storage Option is not the same as the Symantec Backup Exec Shared Storage Option. The Backup Exec SSO does not include support for UNIX servers and uses a different method for drive arbitration.
SAN media servers	A NetBackup SAN media server backs up its own data to shared drives. It cannot back up data on other NetBackup hosts or clients. Symantec licenses NetBackup SAN media servers.
Shared drive	When the Shared Storage Option is installed, a tape drive that is shared among hosts is termed a shared drive. For the drives that are attached to NDMP hosts, each NDMP attach host is considered an additional host.

## About the Shared Storage Option license key

The Shared Storage Option is a feature that is licensed separately from base NetBackup. The NetBackup Shared Storage Option license key is based on the number of physical tape drives to share. The key activates NetBackup to share the specific number of physical drives for which you are licensed.

See [“Licensing the Shared Storage Option”](#) on page 70.

## Licensing the Shared Storage Option

No special installation is required for the Shared Storage Option. When NetBackup software is installed, the Shared Storage Option software also is installed. However, you must activate the feature by entering the Shared Storage Option license key.

---

**Note:** Enter the license key on the NetBackup master server. Also enter the license key on each NetBackup media server that you use for the Shared Storage Option.

---

### To license Shared Storage Option

- 1 To add a license to a specific server, on the **File** menu, click **Change Server** and then select the server.
- 2 In the **NetBackup License Keys** dialog box, click **New**.

- 3 In the **Add a New License Key** dialog box, enter the license key and click **Add** or **OK**.
- 4 Click **Close**.
- 5 Restart all the NetBackup services and daemons.

See [“About the Shared Storage Option license key”](#) on page 70.

## About Shared Storage Option prerequisites

To configure your hardware for use with Shared Storage Option, you must ensure that the following prerequisites are satisfied:

- Configure your SAN environment.
- Attach robots and drives.
- Ensure that all of the servers recognize the shared devices. Device recognition may depend on operating system configuration, as follows:
  - On UNIX or Linux servers, you may have to modify configuration files, such as the sg driver on Solaris systems.
  - On Windows servers, Windows recognizes devices automatically. However, in some instances you may have to install device drivers.

Some of the following tasks may be optional depending on your hardware:

- Determine the physical location of each drive within the robot. Location usually is shown on the connectors to the drives or in the vendor documentation. This task may not be required if NetBackup device discovery accurately determines drive location within the robot.
- Connect all drives and all robots.
- Install SAN connecting hardware (for example, bridges, switches, or hubs).
- If fiber is part of your configuration and you use a SCSI-to-fiber bridge, determine the SCSI-to-Fibre Channel mapping for your tape devices. Hard-wired SCSI IDs are converted to Fibre Channel logical unit numbers (LUNs) that the hosts read. To ensure correct drive assignments, you should know which LUNs map to which physical SCSI IDs. Use persistent LUN mapping if possible.

Familiarity with the hardware and various vendor configuration tools help you accomplish this task. See the vendor documentation for your bridge.
- Record the physical configuration.

When you set up a Shared Storage Option configuration, record your hardware information. Record the adapter, SCSI addresses, World Wide Names (WWNs),

and Fibre Channel LUNs to which you connected each drive. Also, record the version levels of firmware and drivers.

- Install and configure the appropriate drivers. See your vendor documentation for instructions.
- On UNIX and Linux servers, create any device files that are needed. Depending on the operating system, a reconfiguration system start (`boot -r`) may create these files automatically.

Create the device files for each drive; use the Fibre Channel LUNs of the drives and adapters in the device file names. Add the names of the device files to your notes to complete the correlation between device files and physical drive location.

Use the *NetBackup Device Configuration Guide* and the man pages that are available with the operating system.

- On UNIX and Linux servers, customize the operating system by modifying the appropriate system configuration files. This task requires knowledge of the system files that use the Shared Storage Option environment and their formats. For example, on Sun Solaris systems you may need to modify the `sg`, `st`, and HBA driver files.

Modify the HBA driver files to bind Fibre Channel devices (WWN) to a specific target ID. For procedures, see the operating system documentation.

- For instructions on how to configure the HBA on Windows servers, see the HBA documentation from the vendor.
- Use any available hardware configuration interface to configure and ensure that the configuration is what you expect. For example, on Windows servers you can use the Hyperterminal interface to configure SCSI-to-fibre bridges.

Use the following order when you configure and verify the hardware:

- Robot and shared drives
- Bridges
- Hub or switches
- Hosts
- If errors occur and you suspect the operating system, refer to the operating system logs as described in your operating system documentation.

## About hardware configuration guidelines

The following are hardware configuration guidelines:

- If you use SAN hardware from multiple vendors, problems may occur. Always use a SAN configuration and use firmware levels that the hardware vendor supports.
- Consult SAN device, HBA, and operating system documentation to determine how to configure operating system tape drivers and pass-through drivers to detect your SAN devices.
- Check your hub timer settings.
- Use hard arbitrated loop physical addresses rather than soft addresses. Consult with hardware suppliers to verify the recommended usage of their products.
- Check the firmware levels of all your Fibre Channel hardware (for example, bridges). Use the most recent firmware level that is known to operate with other SAN hardware devices.
- Try to duplicate SAN issues and problems using commands and utilities on the host operating system.
- Test both backup and restore capabilities. Backup jobs may complete successfully, but the data may be corrupted. For example, incorrect switch settings may cause problems.
- Ensure that your hardware and SAN configuration are operational and stable before adding Shared Storage Option software.
- Test backup and restore capabilities with dedicated tape drives before you configure them as shared drives.
- For large configurations, begin drive sharing with a few tape drives and two or three media servers (or NetBackup SAN media servers).
- Configuration and troubleshooting processes are easier on smaller configurations. If possible, create multiple and independent Shared Storage Option configurations with subsets of servers sharing subsets of SAN-attached drives.
- Use the correct start order for your Fibre Channel hardware, as follows:
  - Robots or drives
  - Bridges
  - Hubs or switches
  - Hosts
- The start sequence is longer for some devices than others. To verify that the hardware starts completely, examine indicator lights. A green light often indicates a completed start sequence.

## About installing and configuring drivers

On the media server systems, install and configure drivers and modify the appropriate system configuration files.

Guidance about the NetBackup requirements is available.

See the *NetBackup Device Configuration Guide*.

## Verifying the connectivity

Test your hardware configuration before you configure Shared Storage Option in NetBackup. This task is very important and is often overlooked.

Note the following points:

- Verify that all of your servers (master and media) can communicate with one another. To do so, use the `ping` command from each server to every other server. Be sure to `ping` by host name to verify that the name resolution methods function properly.
- Use the NetBackup `bpcIntcmd` utility to resolve IP addresses into host names. For more information, see the *NetBackup Troubleshooting Guide* and the *NetBackup Commands Reference Guide*.
- Use operating system and NetBackup commands and tools to verify that the devices are configured correctly. Make sure that the operating system detects the devices on the SAN before you configure the Shared Storage Option. If the configuration does not work in the operating system, it does not work for the Shared Storage Option.  
For example, on Solaris systems you can use the `mt -f tapename status` command to determine tape drive status.
- For more information and examples, see the appropriate operating system chapter in the *NetBackup Device Configuration Guide*.

## About configuring the Shared Storage Option in NetBackup

You must configure your shared drives, storage units, and backup policies.

About configuring SSO in NetBackup	See <a href="#">“About configuring SSO in NetBackup”</a> on page 75.
Configuring Shared Storage Option devices in NetBackup	See <a href="#">“Configuring Shared Storage Option devices in NetBackup”</a> on page 75.
About adding Shared Storage Option configuration options	See <a href="#">“About adding Shared Storage Option configuration options”</a> on page 75.

About configuring NetBackup storage units and backup policies See [“About configuring NetBackup storage units and backup policies”](#) on page 75.

## About configuring SSO in NetBackup

Symantec recommends that you use the Device Configuration Wizard to configure Shared Storage Option in NetBackup. Identifying devices when you configure shared devices is difficult, and the wizard increases the likelihood of a successful configuration.

With the Device Configuration Wizard, you should configure all shared drives from one host (usually the master server). Launch the wizard only one time with the current host set to the master server. You then indicate a list of media servers or NetBackup SAN media servers (in the Device Hosts screen). The wizard configures devices on all of the media servers you selected, and these hosts read the shared configuration information.

## Configuring Shared Storage Option devices in NetBackup

Symantec recommends that you use the **Device Configuration Wizard** to configure shared drives. The wizard guides you through the steps to configure shared drives.

Be sure to review the limitations of the wizard in the wizard help.

### To start the Device Configuration Wizard

- 1 In the **NetBackup Administration Console**, expand **Media and Device Management**.
- 2 Click **Configure Storage Devices**.

## About adding Shared Storage Option configuration options

You can **fine-tune** your configuration by adding Shared Storage Option options to the `vm.conf` Media Manager configuration file.

See [“About the vm.conf configuration file”](#) on page 85.

## About configuring NetBackup storage units and backup policies

You must configure storage units and policies for your shared drives. If you used the **Device Configuration Wizard** to configure the shared drives, you may have configured storage units and policies already.

For more information, see the following:

- *NetBackup Administrator's Guide for UNIX and Linux, Volume I*
- *NetBackup Administrator's Guide for Windows, Volume I*.

Configure storage units and backup policies as follows:

**Configuring storage units for each media server** In each storage unit definition, logically define the robot and the shared drives for that media server. For the **Maximum concurrent drives** used for backup, specify the total number of all shared drives in the robot. When you configure storage units, select a single media server. Alternatively, you can allow NetBackup to select the media server to use at the time of the backup. For example, you can configure a single storage unit that any media server that shares the storage unit can use.

**Configuring a backup policy for each media server** How you define a policy for a media server depends on your media server license, as follows:

- For a media server that is licensed for Shared Storage Option, the policy can back up the media server and any other NetBackup clients.
- For a NetBackup SAN media server, only the SAN media server can be backed up.

A license for a regular media server provides the greatest flexibility; a license for a NetBackup SAN media server is more restrictive.

For a policy for the clients that you want to back up anywhere in your configuration, you can choose any available storage unit. Alternatively, you can use storage unit groups (prioritized storage units).

## Verifying your Shared Storage Option configuration

In a Shared Storage Option configuration, a shared drive must have the same logical name (drive name) on all of the NetBackup media servers. If the drive resides in a robotic library, it also must use the same drive number in the library. This section describes some tools you can use to verify your configuration.

How you verify that your configuration is set up correctly depends on your devices and how you configured Shared Storage Option, as follows:

- If you have serialized devices, Symantec recommends that you use the Device Configuration Wizard. The wizard verifies your configuration.
- If you have non-serialized devices, see the Symantec support site for a tech note with instructions about how to verify your configuration. The tech note title is "Verifying a Shared Storage Option (SSO) Configuration with Non-Serialized Devices."

- If you have serialized devices but you did not use the Device Configuration Wizard , use the following procedure to verify your configuration.

The verification procedures use the following NetBackup commands:

- On Windows: `install_path\VERITAS\Volmgr\bin\scan`  
On UNIX/Linux: `usr/opensv/volmgr/bin/scan`
- On Windows: `install_path\VERITAS\Volmgr\bin\tpconfig`  
On UNIX/Linux: `usr/opensv/volmgr/bin/tpconfig` commands.

In the following example the ADIC robotic library has six drives, but only drives 5 and 6 are configured on this particular host.

Perform the verification on all of the NetBackup servers in your configuration. Ensure that each shared drive has the same logical drive name and same drive number ID on each media server that shares the drive.

DRAFT

To verify a manually-configured Shared Storage Option configuration

- 1   Execute `tpconfig -d` or `tpconfig -dl`. For NDMP devices, use `tpautoconf -probe -ndmp_host_name host_list`.

The output from `tpconfig` shows the logical names NetBackup assigns to tape drives. The following example shows drive number 5 is named `QUANTUM.DLT7000.000` and drive number 6 is named `QUANTUM.DLT7000.001`:

Id	DriveName	Type	Residence	Status
Drive Path				
*****				
0	QUANTUM.DLT7000.000	dlt	TLD(0) DRIVE=5	
	/dev/st/nh3c0t5l0			UP
1	QUANTUM.DLT.7000.001	dlt	TLD(0) DRIVE=6	
	/dev/st/nh3c0t1l0			UP
Currently defined robotics are:				
	TLD(0)	robotic path =	/dev/sg/h3c0t0l0	
EMM server = norway				

- 2 Execute the `scan` command. The `scan` output shows the robot and the drive properties.

The following is example output:

```

### 3 For each tape drive in the `tpconfig` output, do the following:

- Use the device file name from the `tpconfig` output to locate the tape drive in the `scan` output.  
Step 1 shows device file pathnames `/dev/st/nh3c0t5l0` and `/dev/st/nh3c0t1l0`.
- Determine the serial number of the drive in the scan output. "Tape" in the device type field identifies a tape drive.  
Step 2 shows example `scan` output shows the following:  
The drive `/dev/st/nh3c0t5l0` serial number is PXA37S3261.  
The drive `/dev/st/nh3c0t1l0` serial number is PXA50S2276.

- Verify that the serial number for the drive matches the serial number in the output from the robot section of scan. "Changer" in the device type field identifies a robot.
- In the previous examples, the serial numbers match.

## Device Monitor and Shared Storage Option

You can use the NetBackup Administration Console Device Monitor to obtain information about your Shared Storage Option configuration and manage your shared drives. See the following:

For more information about the Device Monitor, see the *NetBackup Administrator's Guide, Volume I*.

[Table 3-8](#) describes information you can glean from the NetBackup Administration Console Device Monitor.

**Table 3-8** Device Monitor information

Action	Information
Drive Status pane	The <b>Control</b> and <b>Device Host</b> columns contain shared drive information.
Changing the operating mode for a shared drive	For a shared drive, the <b>Change Mode</b> dialog contains a list of all paths to the selected drive. You can choose any number of paths to which the mode change applies.
Adding or changing a comment for a shared drive	<p>For a shared drive, the <b>Change Drive Comment</b> dialog box contains the following:</p> <ul style="list-style-type: none"><li>■ A list of all paths to the selected drive</li><li>■ The current drive comment for each combination.</li></ul> <p>You can choose any number of paths to which the changes apply.</p>
Performing drive cleaning functions for a shared drive	<p>The three available drive cleaning functions are used with shared drives are as follows:</p> <ul style="list-style-type: none"><li>■ <b>Clean Now</b> In the list of hosts that share the drive, you can choose only one host on which the function applies.</li><li>■ <b>Reset Mount Time</b> In the list of hosts that share the drive, you can choose any number of hosts on which the function applies.</li><li>■ <b>Set Cleaning Frequency</b> Supported for shared drives.</li></ul>

## Viewing SSO summary reports

You can view Shared Storage Option Summary reports.

See [“Shared Storage Option summary reports”](#) on page 82.

### To view SSO summary reports

- 1 In the **NetBackup Administration Console**, in the left pane, expand **Media and Device Management > Device Monitor**.
- 2 On the **Actions** menu, select **View Status of Shared Drives**.
- 3 In the **Status of Shared Drives** dialog box, select a device allocation host (or hosts) from the list.
- 4 Use **Add** to move the host to the list of hosts to scan.
- 5 Click **OK**.

The **Shared Drive Summary** and **Device Allocation Host Summary** appear in the two lower panes of the dialog.

### Shared Storage Option summary reports

The following topic applies **only to NetBackup Enterprise Server**.

The following two reports contain the following information about the drives and hosts:

- The **Shared Drive Summary** shows the following:
  - Drive name
  - Device allocation host
  - Number of registered hosts
  - Drive reservation status
  - Hosts that reserve the drive
  - Current scan host
- The **Device Allocation Host Summary** shows the following:
  - Device allocation host
  - Host name of the registered host
  - Number of registered and reserved drives
  - Availability status
  - Scan ability factor

- Scan status (if the host is scan host for at least one SSO drive)

## Operating system assistance

If errors occur during the installation or configuration of the shared devices and you suspect problems with the operating system, refer to the following:

- Operating system logs, as described in the operating system documents.
- NetBackup logs.
- Operating system man pages (UNIX or Linux servers only).
- The *NetBackup Device Configuration Guide*.

## Common configuration issues with Shared Storage Option

If you cannot obtain full functionality after you configure SSO, consider the following:

- Verify that the SAN hardware uses current firmware or drivers. Hardware includes hubs, switches, HBAs, and bridges.
- Verify that the JNI HBA failover value was set to zero to avoid I/O hangs. This value applies to bridges and HBAs.
- Verify that the HBAs with the SCSI-3 protocols are compatible with the operating system drivers.
- Verify that your cluster configuration is supported.  
For more information about cluster configuration, see the *NetBackup Release Notes*.
- Verify that all of your Fibre Channel devices support your Fibre Channel topology. For example, in a switched fabric topology, ensure that all devices supported switched fabric.
- Verify that Shared Storage Option is licensed on each server. To do so, select Help > License keys from the NetBackup Administration Console on each server. To enable Shared Storage Option, enter the Shared Storage Option license key on each server.
- Verify that you configured Shared Storage Option from the master server. You must configure SSO from the master server not from a media server (or SAN media server).
- Verify that you configured the same robot control host on every host. Remember that except for ACS and TLM robot types, only one host controls the robot.

- Verify that you used the Device Configuration Wizard rather than the `tpconfig` utility to configure Shared Storage Option. The wizard coordinates configuration with all hosts that share the drives. The `tpconfig` utility may create inconsistent configurations.
- Verify that you selected the appropriate device hosts in the Device Configuration Wizard, including the host with robotic control.
- Fibre Channel connections to the drives and the robots cause increased complexity in a NetBackup device configuration. On some operating systems, SCSI-to-fibre bridges may result in inconsistencies in the device paths when you restart a host. After a restart of the host, the device configuration should be verified.
- Verify that names across all systems that share the drives are consistent.
- Test the drive paths on every media server.
- Define NetBackup storage units for each media server. Do not select any available media server in the storage units.
- Verify that you did not interrupt a data path during a backup. If you do, the NetBackup job fails. It can fail with media write errors or it may hang and have to be terminated manually.
- Verify that you do not use Berkeley-style close on the tape path (UNIX or Linux servers only).
- On Solaris systems, verify the following:
  - That you added tape configuration list entries in `/kernel/drv/st.conf` (if needed).
  - That you defined configuration entries for expanded targets and LUNs in `sg.links` and `sg.conf` files. If you see problems with the entries in the `/etc/devlink.tab` file (created from `sg.links`), verify the following:  
The first entry uses hexadecimal notation for the target and LUN. The second entry uses decimal notation for the target and LUN.  
Use a single tab character between the entries; do not use a space or a space and a tab character.
  - That you configured the operating system to force load the `sg/st/fcaw` drivers.

For more information, see the Solaris chapter of the *NetBackup Device Configuration Guide*.

## Frequently asked questions about Shared Storage Option

**Q.** What combinations of SAN hardware components are supported for Shared Storage Option?

**A.** Shared Storage Option works with many hardware combinations. Symantec has an open policy on hardware support for Shared Storage Option. Consult your hardware suppliers to verify the interoperability of their products.

A list of SAN components that have been tested with NetBackup is available on the Symantec support Web site:

<http://entsupport.symantec.com>

**Q.** If NetBackup allocates four drives to a server and it finishes with two of the drives, does NetBackup reallocate the two drives? Or does NetBackup wait until the backup schedule that uses the four drives is completely finished before it reallocates the drives?

**A.** The two available drives are reallocated and used. NetBackup monitors drive status and notifies the NetBackup scheduler of drive availability.

**Q.** Does NetBackup Shared Storage Option use the IP protocol or the SCSI protocol?

**A.** Both. IP protocol is used to provide coordination between servers. Shared Storage Option uses SCSI protocol (SCSI reserve) as an added layer of protection.

## About the vm.conf configuration file

The `vm.conf` file contains configuration entries for media and device management. NetBackup can create this file, but if it does not exist, you must create it.

On Windows, the pathname is `install_path\Volmgr\vm.conf`.

On UNIX, the pathname is `/usr/opensv/volmgr/vm.conf`.

Various NetBackup components read this configuration file on the host where the component runs. The NetBackup component is a command, daemon, process, or utility. The host can be a NetBackup administration client or a server where administration operations are requested.

See “[Example vm.conf file](#)” on page 103.

## ACS\_mediatype entry in vm.conf

This configuration entry applies only to the NetBackup Enterprise Server as follows:

```
ACS_mediatype = Media_Manager_mediatype
```

If this entry is used in `vm.conf`, the ACS media type is mapped to the specified Media Manager media type. More than one `ACS_mediatype` entry can be specified.

This entry is read and interpreted on the host on which `vmcheckxxx` and `vmupdate` run during a robot inventory operation. Use this entry on every NetBackup media server that functions as an ACS robot control host.

A list of the valid `ACS_mediatype` entries is available.

See the *NetBackup Administrator's Guide, Volume I*.

## ACS\_SEL\_SOCKET entry in `vm.conf`

This configuration entry applies only to the NetBackup Enterprise Server as follows:

```
ACS_SEL_SOCKET = socket_name
```

By default, `acssel` listens on socket name 13740. If this entry is specified in `vm.conf`, the default can be changed. This entry is read and interpreted on the host on which `acsd` runs.

## ACS\_CSI\_HOSTPORT entry in `vm.conf` (on UNIX)

This configuration entry applies only to the NetBackup Enterprise Server as follows:

```
ACS_CSI_HOSTPORT = ACS_library_software_hostname socket_name
```

The valid value for `ACS_library_software_hostname` is the host name of the ACS library host. Do not use the IP address of the ACS library host for this parameter.

The valid values for `socket_name` are 1024 - 65535 and 0. The value must match the value on the ACSLS server for the port that the CSI uses for inbound packets.

If 0 (zero), NetBackup uses the previous behavior of CSI and `acsssi` (no specific ports).

This entry specifies the port where the `acsssi` process sends its ACSLS requests on the ACSLS server. The ACSLS CSI must use this port to accept inbound ACSLS requests from `acsssi` processes.

This entry, the `ACS_SSI_INET_PORT` entry, and the `ACS_TCP_RPCSERVICE` entry are commonly used with firewall implementations. With these three entries in the `vm.conf` file, TCP connections use the designated destination ports. Note that TCP source ports are not restricted.

See [“ACS\\_SSI\\_INET\\_PORT entry in `vm.conf` \(on UNIX\)”](#) on page 87.

See [“ACS\\_TCP\\_RPCSERVICE/ACS\\_UDP\\_RPCSERVICE entry in `vm.conf` \(on UNIX\)”](#) on page 89.

For example, a NetBackup media server has two ACSLS servers (`ACSL_1` and `ACSL_2`) behind firewalls. Both servers listen for queries on port 30031 and the firewall allows traffic through this port.

The `vm.conf` entries are as follows:

```
ACS_TCP_RPCSERVICE
ACS_CSI_HOSTPORT = ACSLS_1 30031
ACS_CSI_HOSTPORT = ACSLS_2 30031
ACS_SSI_INET_PORT = ACSLS_1 30032
ACS_SSI_INET_PORT = ACSLS_2 30033
```

Each `acsssi` process sends queries to the respective ACSLS server's port 30031, and the ACSLS server is configured to listen for queries on this port.

## ACS\_SSI\_HOSTNAME entry in `vm.conf`

This configuration entry applies only to the NetBackup Enterprise Server as follows:

```
ACS_SSI_HOSTNAME = host
```

Use `ACS_SSI_HOSTNAME` to specify the host to which RPC return packets from ACS library software are routed for ACS network communications. By default, the local host name is used. This entry is read and interpreted on the host on which `acsd` and `acsssi` run. Do not use the IP address of the host for this parameter.

## ACS\_SSI\_INET\_PORT entry in `vm.conf` (on UNIX)

This configuration entry applies only to the NetBackup Enterprise Server as follows:

```
ACS_SSI_INET_PORT = ACS_library_software_hostname socket_name
```

The valid value for `ACS_library_software_hostname` is the host name of the ACS library host. Do not use the IP address of the ACS library host for this parameter.

The `socket_name` entry specifies the port that `acsssi` uses for incoming ACSLS responses. Valid values are 1024 - 65535 and 0. This value must be unique for each `acsssi` process.

A value between 1024 - 65535 indicates the number to be used as the TCP port on which `acsssi` accepts ACSLS responses.

0 (zero) indicates that the previous behavior (allow the port to be dynamically allocated) should remain in effect.

This entry, the `ACS_CSI_HOSTPORT` entry, and the `ACS_TCP_RPCSERVICE` entry are commonly used with firewall implementations. With these three entries in the `vm.conf` file, TCP connections use the designated destination ports. Note that TCP source ports are not restricted.

See “[ACS\\_CSI\\_HOSTPORT entry in vm.conf \(on UNIX\)](#)” on page 86.

See “[ACS\\_TCP\\_RPCSERVICE / ACS\\_UDP\\_RPCSERVICE entry in vm.conf \(on UNIX\)](#)” on page 89.

For example, a NetBackup media server has two ACSLS servers (`ACSL_1` and `ACSL_2`) behind firewalls. Ports 30032 and 30033 have been opened in the firewall for `acsssi` to ACSLS server communication.

The entries would be as follows:

```
ACS_TCP_RPCSERVICE
ACS_SSI_INET_PORT = ACSLS_1 30032
ACS_SSI_INET_PORT = ACSLS_2 30033
ACS_CSI_HOSTPORT = ACSLS_1 30031
ACS_CSI_HOSTPORT = ACSLS_2 30031
```

The NetBackup media server starts two `acsssi` processes. One listens for `ACSL_1` responses on port 30032, and the other listens on port 30033 for responses from `ACSL_2`.

## ACS\_SSI\_SOCKET entry in `vm.conf`

This configuration entry applies only to the NetBackup Enterprise Server as follows:

```
ACS_SSI_SOCKET = ACS_library_software_hostname socket_name
```

The valid value for `ACS_library_software_hostname` is the host name of the ACS library host. Do not use the IP address of the ACS library host for this parameter.

By default, `acsssi` listens on unique, consecutive socket names; the names begin with 13741. If this entry is specified in `vm.conf`, specify socket names on an ACS library software host basis. This entry is read and interpreted on the host where `acsd` and `acsssi` are running.

## ACS\_TCP\_RPCSERVICE / ACS\_UDP\_RPCSERVICE entry in `vm.conf` (on UNIX)

These configuration entries apply only to the NetBackup Enterprise Server as follows:

```
ACS_TCP_RPCSERVICE
ACS_UDP_RPCSERVICE
```

These entries specify the method over which `acsssi` communicates with ACSLS servers: TCP or UDP.

Only one entry should be entered into `vm.conf`. NetBackup uses UDP if both entries are found or neither entry is found.

For `acsssi` firewall support, `ACS_TCP_RPCSERVICE` **must** be entered in `vm.conf`.

See [“ACS\\_CSI\\_HOSTPORT entry in `vm.conf` \(on UNIX\)”](#) on page 86.

See [“ACS\\_SSI\\_INET\\_PORT entry in `vm.conf` \(on UNIX\)”](#) on page 87.

## ADJ\_LSM entry in `vm.conf`

This configuration entry applies only to the NetBackup Enterprise Server as follows:

```
ADJ_LSM = robot_num ACS_ID,LSM_ID ACS_ID,LSM_ID
```

In an ACS robot with multiple library storage modules (LSMs), pass-through mechanisms can move ejected media to the media access port (MAP). A pass-through mechanism passes media from one LSM to another. This travel time can be excessive when media must pass through several LSMs.

Use this entry to specify the physical orientation of the LSMs in an ACS robot. If this entry is specified in `vm.conf`, you do not need to know which MAP (or ACS CAP) to select for efficient ejects. NetBackup determines the appropriate MAP to complete the media eject by using a nearest-MAP algorithm.

This nearest-MAP algorithm is based on the physical orientation of the LSMs that defined with this entry. This algorithm is only for the cases where more than one MAP is requested to handle the eject. If this algorithm is used, any `MAP_ID` entries in `vm.conf` are ignored.

---

**Note:** nearest-MAP capability is only available by using the `vmchange` command with the `-map` option or the Vault administrative interface. It is not available from the NetBackup Administration Console.

---

Without this entry present, NetBackup assumes that all LSMs are interconnected with pass-through ports, except for the first LSM and the last LSM. The LSMs are interconnected in a line formation.

*robot\_num* is the robot number. *ACS\_ID* and *LSM\_ID* are the coordinates of the LSM.

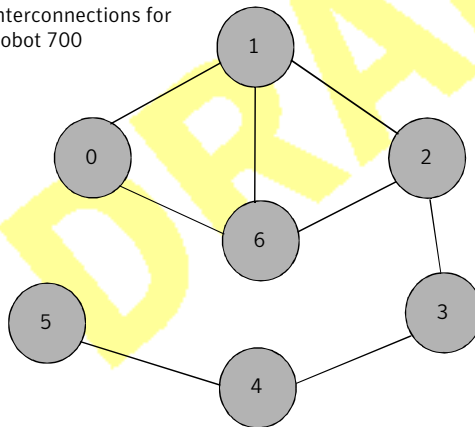

Figure 3-4 is a diagram of LSM interconnections that are described by the following entries:

```
ADJ_LSM = 700 0,0 0,1
ADJ_LSM = 700 0,0 0,6
ADJ_LSM = 700 0,1 0,2
ADJ_LSM = 700 0,1 0,6
ADJ_LSM = 700 0,2 0,6
ADJ_LSM = 700 0,2 0,3
ADJ_LSM = 700 0,3 0,4
ADJ_LSM = 700 0,4 0,5
```

The robot has pass-through mechanisms between 7 LSMs.

**Figure 3-4** Pass-through example

Interconnections for  
Robot 700

## API\_BARCODE\_RULES entry in `vm.conf`

This configuration entry applies only to the NetBackup Enterprise Server as follows:

```
API_BARCODE_RULES
```

If this entry is specified in `vm.conf`, barcode rule support for API robots is enabled.

NetBackup barcode rules allow default media mappings to be overridden. Barcode rules are especially useful when multiple generations of the same tape drive use the same type of media.

For example STK 9940A and STK 9940B drives use STK1R media, but write data at different densities. The drive must be configured by using different drive types such as HCART or HCART2. Specify a barcode rule for a series of bar codes to configure some of the media as HCART2. Other STK1R media not in this barcode range are configured as HCART (the default for STK1R). Without this entry, a robot inventory operation configures all media of type STK1R as either HCART or HCART2, depending on how the drive was configured.

## AUTHORIZATION\_REQUIRED entry in `vm.conf`

This entry specifies that NetBackup should use the `vm.conf` file `SERVER` entry to control which hosts can monitor and control devices on this host. This entry is read and interpreted on the media server on which the NetBackup `vmd` service runs, as follows:

```
AUTHORIZATION_REQUIRED
```

If this entry is specified in `vm.conf`, the `vm.conf` file also must include a `SERVER` entry for every media server that controls devices on this host.

If no `AUTHORIZATION_REQUIRED` entry exists and no `SERVER` entries exist, any NetBackup server can monitor and control devices on this host.

For maximum security, Symantec recommends that you use this entry and `SERVER` entries.

This entry is read and interpreted on media servers on which the NetBackup `vmd` service runs.

## AUTO\_PATH\_CORRECTION entry in `vm.conf`

If this entry is specified in `vm.conf`, it specifies whether automatic device path remapping is enabled or disabled, as follows:

```
AUTO_PATH_CORRECTION = YES|NO
```

If the value is `NO`, the device configuration remains unchanged when the NetBackup Device Manager service (`ltid`) is started. Therefore, the saved device configuration may be different than the actual configuration after devices are changed and the server is restarted.

If the value is `YES`, NetBackup tries to discover attached devices and then automatically update the device configuration for any device paths that are

incorrect. On Windows computers, this entry is read and interpreted on the host on which the NetBackup Device Manager service runs. On UNIX and Linux computers, this entry is read and interpreted on the host on which `ltid` runs.

Device path remapping is enabled by default on Windows and Linux servers. It is disabled by default on all other servers.

## AUTO\_UPDATE\_ROBOT entry in `vm.conf`

Use this entry to inject media automatically from the Media Access Port (MAP) into a TL8 or TLD robot and update the EMM database. Media are injected if the robot generates a unit attention message.

`AUTO_UPDATE_ROBOT`

This entry only operates with the TL8 or TLD robots that post a unit attention when their MAP is opened.

Symantec recommends that this entry **not** be used with partitioned libraries. Most robotic libraries with multiple partitions do not post a unit attention when the MAP is opened.

## AVRD\_PEND\_DELAY entry in `vm.conf`

If this entry is specified in `vm.conf`, `avrd` waits *number\_of\_seconds* before it displays a pending status (PEND) in the Device Monitor. This entry is read and interpreted on the host on which `avrd` runs.

`AVRD_PEND_DELAY = number_of_seconds`

On some server operating systems (Windows and HP-UX), NetBackup reports PEND if the drive reports Busy when a volume is unmounted. Use this entry to minimize the display of this misleading status.

The minimum for *number\_of\_seconds* is zero. The maximum is 255. The default value is 180 seconds.

## AVRD\_SCAN\_DELAY entry in `vm.conf`

If this entry is specified in `vm.conf`, `avrd` waits *number\_of\_seconds* between normal scan cycles. This entry is read and interpreted on the host on which `avrd` runs.

`AVRD_SCAN_DELAY = number_of_seconds`

Use this entry to minimize tape mount times. Without this entry, NetBackup delays mount requests by an average of 7.5 seconds.

The minimum for *number\_of\_seconds* is 1. The maximum is 180. A value of zero converts to one second. The default value is 15 seconds. If a value is used that is greater than the default, NetBackup delays mount requests and drive status updates in the Device Monitor.

---

**Note:** If *number\_of\_seconds* is set to a value that allows media to be changed within one scan cycle, NetBackup may not detect media changes. Data loss may occur.

---

## CLEAN\_REQUEST\_TIMEOUT entry in `vm.conf`

Use this entry to specify how long NetBackup waits for a drive to be cleaned before it removes the cleaning request from the cleaning queue. Unprocessed requests to clean a drive are removed from the queue after 30 minutes.

```
CLEAN_REQUEST_TIMEOUT = minutes
```

The *minutes* can be from 1 to 144000 (100 days). The default value is 30 and a value of zero converts to the default value of 30.

## CLIENT\_PORT\_WINDOW entry in `vm.conf`

Use this entry to specify the range of non-reserved ports on this host that are used to connect to `vmd` on other hosts. This entry is read and interpreted on the host on which `vmd` runs.

```
CLIENT_PORT_WINDOW = start end
```

For example, the following entry permits ports from 4800 through 5000:

```
CLIENT_PORT_WINDOW = 4800 5000
```

The operating system determines the non-reserved port to use in the following cases:

- A `CLIENT_PORT_WINDOW` entry is not specified.
- A value of zero is specified for *start*.

## CLUSTER\_NAME entry in `vm.conf`

This entry specifies the virtual name for the media server on which the `vm.conf` file resides.

```
CLUSTER_NAME = cluster_alias
```

See [“Host name precedence in the `vm.conf` file”](#) on page 103.

## CONNECT\_OPTIONS entry in `vm.conf`

This entry only affects connections to NetBackup 7.0 and earlier. For connections to NetBackup 7.0.1 and later, the `veritas_pbx` port is used.

Add this entry in `vm.conf` to specify the options that enhance firewall efficiency with NetBackup. The server connection options can be any of the following: use `vnetd` or the daemon's port number, use only `vnetd`, or use only the daemon's port number.

```
CONNECT_OPTIONS = server_name 0 0 [0|1|2]
```

`CONNECT_OPTIONS` entries can be specified for multiple servers.

For UNIX, you can also use a similarly named entry in the NetBackup configuration file (`/usr/openv/netbackup/bp.conf`).

See the *NetBackup Administrator's Guide, Volume I*.

`server_name` is the name of the media server to connect to.

The first and second options currently **are not used**. Specify **zero** for these options.

The third option specifies the connection method to use to connect to `server_name` as follows:

- A value of 0 specifies to use `vnetd` to connect to a daemon on the server. If the `vnetd` service is **not active**, connect by using the traditional port number of the daemon.
- A value of 1 specifies to use `vnetd` only to connect to a daemon on the server.
- A value of 2 specifies to use the traditional port number of the daemon to connect to the daemon on the server. The default value is 2.

The following example entry specifies to use either `vnetd` or the daemon's port number to connect to server `shark`:

```
CONNECT_OPTIONS = shark 0 0 0
```

The following example entry specifies to use `vnetd` only to connect to server `dolphin`:

```
CONNECT_OPTIONS = dolphin 0 0 1
```

The following example entry specifies to use the daemons's port number only to connect to server `perch`:

```
CONNECT_OPTIONS = perch 0 0 2
```

## DAS\_CLIENT entry in `vm.conf`

This configuration entry applies only to the NetBackup Enterprise Server.

```
DAS_CLIENT = client_name
```

If this entry is specified in `vm.conf`, specify the DAS client name that the TLM robot uses for communications with the DAS/SDLC server. By default, this client name is the host name of the media server. This entry is read and interpreted on the host where `tlmd` is running.

## DAYS\_TO\_KEEP\_LOGS entry in `vm.conf`

If this entry is specified in `vm.conf`, specify the number of days to keep debug logs before `vmd` deletes them. This entry is read and interpreted on the hosts where `vmd` is running.

```
DAYS_TO_KEEP_LOGS = days
```

A value of zero means that the logs are not deleted. The default is zero. This entry does not affect the debug logs that Unified Logging creates.

Information about Unified Logging is available.

See the *NetBackup Troubleshooting Guide*.

## EMM\_RETRY\_COUNT entry in `vm.conf`

The `vmd` daemon and the `ltid` daemon use this entry to determine how many times to retry requests to the NetBackup Enterprise Media Manager.

```
EMM_RETRY_COUNT = number_of_retries
```

The default is one retry.

Only change the value of this `vm.conf` file entry when directed to do so by a NetBackup support representative. If this entry is added to the `vm.conf` file or if this value is changed, restart the `vmd` daemon and the `ltid` daemon.

## EMM\_CONNECT\_TIMEOUT entry in `vm.conf`

This value applies for broken connections between the NetBackup Enterprise Media Manager and the following daemons: the `vmd` daemon and the `ltid` daemon. These two daemons use this entry to determine for how long they should try to reconnect to the NetBackup Enterprise Media Manager.

```
EMM_CONNECT_TIMEOUT = number_of_seconds
```

The default is 20 seconds.

Only change the value of this `vm.conf` file entry when directed to do so by a NetBackup support representative. If this entry is added to the `vm.conf` file or if this value is changed, restart the `vmd` daemon and the `ltid` daemon.

## EMM\_REQUEST\_TIMEOUT entry in `vm.conf`

The `vmd` daemon and the `ltid` daemon use this entry to determine how many seconds to allow a request to the NetBackup Enterprise Media Manager to complete.

```
EMM_REQUEST_TIMEOUT = number_of_seconds
```

The default is 300 seconds.

Only change the value of this `vm.conf` file entry when directed to do so by a NetBackup support representative. If this entry is added to the `vm.conf` file or if this value is changed, restart the `vmd` daemon and the `ltid` daemon.

## ENABLE\_ROBOT\_AUTH entry in `vm.conf`

Symantec encourages the use of Symantec Product Authentication and Authorization for NetBackup Access Control (NBAC) instead of legacy security implementations.

For information about the `ENABLE_ROBOT_AUTH` configuration entry, see the NetBackup 6.0 documentation. Information on Symantec Product Authentication and Authorization is available.

See the *NetBackup Security and Encryption Guide*.

## INVENTORY\_FILTER entry in `vm.conf`

This configuration entry applies only to the NetBackup Enterprise Server.

```
INVENTORY_FILTER = robot_type robot_number mode value1 [value2 ...]
```

Used to filter the robot inventory results in ACS or TLH robot types. Add this entry to the configuration file (`vm.conf`) on the NetBackup server on which the inventory operation is invoked. This entry is read and interpreted on the host on which `vmcheckxxx` and `vmupdate` run.

---

**Note:** This entry may be required for an ACS robot and the ACS library software host with an STK Library Station. Newer versions of STK Library Station allow robot inventory commands to function correctly so filters are not required.

---

*robot\_type* can be ACS or TLH.

*robot\_number* is the number of the robot as was configured in NetBackup.

*mode* is BY\_ACS\_POOL for ACS or BY\_CATEGORY for TLH.

See the following examples:

```
INVENTORY_FILTER = ACS 0 BY_ACS_POOL 4 5
INVENTORY_FILTER = TLH 0 BY_CATEGORY FFFA CDB0
```

## MAP\_ID entry in vm.conf

This configuration entry applies only to the NetBackup Enterprise Server.

```
MAP_ID = robot_num map_ID
```

Use this entry to configure the default media access port (MAP) to use to eject media from the Automated Cartridge System (ACS) robots. This default is selected in the NetBackup Administration Console, but you can also select other Media Access Ports for ejects.

If the MAP is not available or the vm.conf file does not contain this entry, NetBackup uses the default MAP selection process. By default, NetBackup uses the smallest MAP that can hold the number of media to be ejected.

If NetBackup selects multiple MAPs, NetBackup uses the nearest-MAP algorithm rather than the MAP that is specified in the MAP ID entry.

See “[ADJ\\_LSM entry in vm.conf](#)” on page 89.

*robot\_num* is the robot number. *map\_ID* is in the format of an ACS CAP (cartridge access port ) ID and cannot contain any spaces.

The following example specifies the MAP ID for ACS robot number 700. The ACS CAP ID of 0,1,0 is used.

```
MAP_ID = 700 0,1,0
```

## MAP\_CONTINUE\_TIMEOUT entry in vm.conf

This entry applies only when the vmchange command is used and the -w option is specified.

```
MAP_CONTINUE_TIMEOUT = seconds
```

The default timeout value for *seconds* is 300 (5 minutes). *seconds* cannot be zero and values greater than 1200 (20 minutes) can cause the robotic daemon to cancel the operation.

If this entry is specified in `vm.conf`, the SCSI robotic daemons wait the specified number of seconds before they time out. A timeout can occur while the daemons wait for user reply after the user removes volumes from the media access port. If a timeout occurs, NetBackup aborts the operation.

This entry is read and interpreted on the host on which the SCSI-controlled robotic daemon or process runs.

---

**Note:** Non-mount activities such as a robotic inventory cannot occur during this timeout period.

---

## MEDIA\_ID\_BARCODE\_CHARS entry in `vm.conf`

If this entry is specified in `vm.conf`, it controls the NetBackup media ID generation. This entry is read and interpreted on the host on which `vmcheckxxx` and `vmupdate` run as part of the robot inventory operation.

```
MEDIA_ID_BARCODE_CHARS = robot_num barcode_length media_ID_rule
```

---

**Note:** To use this entry, the robot must support bar codes and the robot type cannot be an API robot.

---

Choose how NetBackup creates media IDs by defining the rules that specify which characters of a barcode on tape NetBackup uses. Alphanumeric characters can be specified to be inserted in the ID.

Multiple entries can be added to the `vm.conf` file. For example, specify media ID generation for each robot or for each barcode format that has different numbers of characters. The multiple entries allow flexibility for multimedia.

If no `MEDIA_ID_BARCODE_CHARS` entries exist or the entry is invalid, NetBackup uses the rightmost six characters of the barcode to create its media ID.

*robot\_num* is the robot number.

*barcode\_length* is the length of the barcode.

A *media\_ID\_rule* consists of a maximum of six fields that colons delimit. Numbers in the fields define the positions of the characters in the barcode that NetBackup extracts (from left to right). For example, if the number 2 is in a field, NetBackup extracts the second character from the barcode. The numbers can be specified in any order.

If the pound sign (#) prefixes a character, that character is inserted in that position in the generated ID. Any alphanumeric characters must be valid for a media ID. Use rules to create media IDs of many different formats. However, if the generated

media ID is different from the label on the media, media management may be more difficult.

The following is an example rule and the resulting generated media ID:

```
Barcode on the tape: 032945L1
Media ID rule:      #N:2:3:4:5:6
Generated media ID: N32945
```

## MEDIA\_ID\_PREFIX entry in vm.conf

If this entry is specified in `vm.conf`, it defines the media ID prefixes to use for media without bar codes. This entry is read and interpreted on the host where `vmcheckxxx` and `vmupdate` are running as part of the robot inventory operation.

```
MEDIA_ID_PREFIX = media_id_prefix
```

The best way to add media to a robot is to use the Robot Inventory Update Volume Configuration operation.

## MM\_SERVER\_NAME entry in vm.conf

This entry specifies the name that other NetBackup servers and clients should use when they refer to this server.

```
MM_SERVER_NAME = host_name
```

See [“Host name precedence in the vm.conf file”](#) on page 103.

## PREFERRED\_GROUP entry in vm.conf

Symantec encourages the use of Symantec Product Authentication and Authorization for NetBackup Access Control (NBAC) instead of legacy security implementations.

For information about the `PREFERRED_GROUP` configuration entry, see the NetBackup 6.0 documentation. Information on Symantec Product Authentication and Authorization is available.

See the *NetBackup Security and Encryption Guide*.

## PREVENT\_MEDIA\_REMOVAL entry in vm.conf

This topic applies to the TL8 robots only.

Specifying this entry changes the default operation for TL8 robots. Without this entry present, NetBackup allows the removal of media.

If this entry is specified in `vm.conf`, TL8 robots run the SCSI command `PREVENT MEDIUM REMOVAL`. The robot's main door or the MAP cannot be opened while the robotic control daemon runs.

This entry is read and interpreted on the host on which the TL8 robot control daemon or process (`tl8cd`) runs.

To override `PREVENT_MEDIA_REMOVAL`, do one of the following:

- Use the test utility and run `allow media removal`.
- Use inject or eject for access, when volumes are added or moved.

## RANDOM\_PORTS entry in `vm.conf`

Use this entry to specify whether NetBackup chooses port numbers randomly or sequentially for communication with other NetBackup servers. This entry is read and interpreted on hosts on which `vmd` runs.

```
RANDOM_PORTS = YES|NO
```

If `YES` or no entry exists (the default), NetBackup chooses port numbers randomly from those that are available in the allowed range.

If `NO`, NetBackup chooses numbers sequentially. NetBackup begins with the highest number in the allowed range, and then tries the next highest, and so on until a port is available.

On UNIX, if random ports are not specified in the NetBackup configuration, specify `RANDOM_PORTS = NO` in the `vm.conf` file.

See the *NetBackup Administrator's Guide, Volume I*.

To specify no random ports in the NetBackup configuration file, do one of the following:

- Specify `RANDOM_PORTS = NO` in the `bp.conf` file on UNIX.
- Use the NetBackup **Host Properties** on Windows.

## REQUIRED\_INTERFACE entry in `vm.conf`

This entry specifies the name of the network interface that the media server uses to connect to another media server.

```
REQUIRED_INTERFACE = host_name
```

A NetBackup server can have more than one network interface, and by default the operating system determines the one to use. To force NetBackup to connect

through a specific network interface, use `REQUIRED_INTERFACE` and specify the name of that network interface.

See [“Host name precedence in the `vm.conf` file”](#) on page 103.

## SERVER entry in `vm.conf`

This entry determines the name other NetBackup servers should use when they refer to this server.

`SERVER` entries in the `vm.conf` file are used for NetBackup media server security.

```
SERVER = host_name
```

`SERVER` entries work with the `AUTHORIZATION_REQUIRED` entry to control which hosts can monitor and control devices on this host.

If the `AUTHORIZATION_REQUIRED` entry exists, the `vm.conf` file must include a `SERVER` entry for every media server that controls devices on this host. If the `vm.conf` file contains any `SERVER` entries, it also must include a `SERVER` entry for itself or it cannot manage its own devices.

If no `AUTHORIZATION_REQUIRED` entry exists and no `SERVER` entries exist, any NetBackup server can monitor and control devices on this host.

For security, the entries that allow only specific hosts to access the devices must be added remotely.

This entry is read and interpreted on media servers on which the NetBackup `vmd` service runs.

## SSO\_DA\_REREGISTER\_INTERVAL entry in `vm.conf`

This entry determines the name other NetBackup servers should use when they refer to this server.

This configuration entry applies only to the NetBackup Enterprise Server.

```
SSO_DA_REREGISTER_INTERVAL = minutes
```

This `vm.conf` entry is for the Shared Storage Option (SSO) for Tape feature only. It is read and interpreted on the host on which `ltid` runs.

`ltid` on a scan host periodically registers its shared drives with `EMM/DA` to ensure that it is still provides the drive scanning function. Only one of the hosts that share a drive scan the drive. This reregistration allows conditions such as a device allocator restart to have minimal effect on use of shared drives.

The default for the reregistration interval is 5 minutes. Use the `SSO_DA_REREGISTER_INTERVAL` entry to tune this interval. After the entry is added, stop and restart `ltid` for the change to take effect.

## SSO\_DA\_RETRY\_TIMEOUT entry in `vm.conf`

This configuration entry applies only to the NetBackup Enterprise Server.

```
SSO_DA_RETRY_TIMEOUT = minutes
```

This `vm.conf` entry is for the Shared Storage Option (SSO) for Tape feature only. It is read and interpreted on the host on which `ltid` runs.

The Device Manager `ltid` delays before if one of the following events occurs:

- Problems during communications with EMM/DA.
- Failure trying to reserve a shared drive.

The default value for the delay is 3 minutes. Use the `SSO_DA_RETRY_TIMEOUT` entry to tune this delay period. After the entry is added, stop and restart `ltid` for the change to take effect.

## SSO\_HOST\_NAME entry in `vm.conf`

This configuration entry applies only to the NetBackup Enterprise Server.

```
SSO_HOST_NAME = host_name
```

This `vm.conf` entry is for the Shared Storage Option (SSO) for Tape feature only. It is read and interpreted on the host on which `ltid` runs.

This entry specifies the name that the current host uses to register, reserve, and release shared drives with EMM/DA. The default is the local host name.

## TLH\_mediatype entry in `vm.conf`

This configuration entry applies only to the NetBackup Enterprise Server.

```
TLH_mediatype = Media_Manager_mediatype
```

If this entry is specified in `vm.conf`, IBM ATL media types in tape library Half-inch (TLH) robots are mapped to Media Manager media types. This entry is read and interpreted on the host where `vmcheckxxx` and `vmupdate` are running as part of the robot inventory operation.

## TLM\_mediatype entry in vm.conf

This configuration entry applies only to the NetBackup Enterprise Server.

```
TLM_mediatype = Media_Manager_mediatype
```

If this entry is specified in `vm.conf`, DAS/SDLC media types in tape library Multimedia (TLM) robots are mapped to Media Manager media types. This entry is read and interpreted on the host where `vmcheckxxx` and `vmupdate` are running as part of the robot inventory operation.

## VERBOSE entry in vm.conf

If this entry is specified in `vm.conf`, all Media Manager components on the host are started with verbose logging enabled.

Use this option only if problems occur or if requested by Symantec support. After the problem is resolved, remove the debug logs or add a `DAYS_TO_KEEP_LOGS` entry.

## Example vm.conf file

The following is an example of a `vm.conf` file, on host server1:

```
SERVER = server1
SERVER = server2
MEDIA_ID_PREFIX = NV
MEDIA_ID_PREFIX = NETB
ACS_3490E = HCART2
```

## Host name precedence in the vm.conf file

NetBackup identifies the media server by using the following name precedence:

- `CLUSTER_NAME` entry if present in `vm.conf`.
- `MM_SERVER_NAME` entry if present in `vm.conf`.
- `REQUIRED_INTERFACE` entry if present in `vm.conf`.
- The same name that NetBackup uses.  
On UNIX, the NetBackup name is configured in the `bp.conf` file.
- `gethostname()` name.

DRAFT

# Menu user interfaces on UNIX

This chapter includes the following topics:

- [About menu user interfaces](#)
- [About the bpadm NetBackup management utility](#)
- [About the vmadm media management utility](#)
- [About the tpconfig device configuration utility](#)
- [About the NetBackup Disk Configuration Utility](#)

## About menu user interfaces

The following menu user interfaces are available on UNIX or Linux systems to manage NetBackup:

- See [“About the bpadm NetBackup management utility”](#) on page 106.
- See [“About the vmadm media management utility”](#) on page 124.
- See [“About the tpconfig device configuration utility”](#) on page 135.
- See [“About the NetBackup Disk Configuration Utility”](#) on page 144.

These utilities are alternatives to using the NetBackup Administration Console. The terminology, general concepts, and results are the same regardless of the administration method that is used.

## About the `bpadm` NetBackup management utility

The NetBackup `bpadm` administrator utility is a character-based, menu-driven interface. It can be used at any terminal (or terminal emulation window) for which `termcap` or `terminfo` is defined.

---

**Note:** Use `bpadm` only on the master server. Make sure that no other instances of `bpadm` or the NetBackup Administration Console are active while the configuration is modified. To modify the configuration by using multiple utilities may produce unpredictable results.

---

Start the `bpadm` program by running the `bpadm` command as a root user. `bpadm` is located in the following directory:

`/usr/opensv/netbackup/bin`

The main menu contains the following information:

```
NetBackup Server: server_name

NetBackup Administration
-----
d) Data Classification Management...
s) Storage ...
p) Policy Management...
g) Global Configuration...
f) Fibre Channel Transport Management...
r) Reports...
m) Manual Backups...
x) Special Actions...
u) User Backup/Restore...
e) Media Management...
o) Server Group Management...
h) Help
q) Quit

ENTER CHOICE:
```

All menus provide online Help . Press the escape (**Esc**) key to end most operations.

## Data Classification Management menu

Use the Data Classifications menu to view, add, and modify data classifications as in the following example:

```
Name: <ALL>
Description: <ALL>
Rank: <ALL>
Classification ID: <ALL>
Output Destination: SCREEN

Data Classifications
-----
a) Add Data Classification ...
m) Modify Data Classification ...
k) Modify Data Classification Ranks

b) Browse Data Classifications Forward
r) Browse Data Classifications Reverse
e) Enter
l) List/Display Data Classifications
o) Output Destination (SCREEN or FILE)
h) Help
q) Quit
```

## Storage menu

Use the Storage menu to define and manage storage units. To display the Storage menu, press **s** (Storage...) on the bpadm main menu.

The Storage menu contains the following information:

```
Storage
-----
u) Storage Unit Management ...
g) Storage Unit Group Management ...
s) Storage Lifecycle Policy Management ...

h) Help
q) Quit Menu
```

## Storage Unit Group Management menu

A storage unit group is a list of storage units, ordered by priority. The Storage Unit Group Management menu contains options to define and manage storage unit groups. Create a storage unit group to define sets of storage units and to assign priorities to one or more storage units.

To display this menu, press **g** on the Storage main menu.

The Storage Unit Group Management menu contains the following information:

```
Storage Unit Group Label: <ALL>
Output Destination: SCREEN

Storage Unit Group Management
-----
a) Add Storage Unit Group...
m) Modify Storage Unit Group...
d) Delete Storage Unit Group

b) Browse Storage Unit Groups Forward
r) Browse Storage Unit Groups Reverse
e) Enter Storage Unit Group
l) List/Display Storage Unit Groups
o) Output Destination (SCREEN or FILE)
h) Help
q) Quit Menu

ENTER CHOICE:
```

## Storage Lifecycle Policy Management menu

To display this menu, press **s** on the Storage main menu.

A lifecycle is a list of destinations where copies of the backup images are stored, along with the prescribed retention period for each copy. After a lifecycle is configured, the lifecycle process works to create copies of the images on each destination.

The Storage Lifecycle Policy Management menu contains the following information:

```
Storage Lifecycle Policy Name: <ALL>
Data Classification: SCREEN
Jobs/Services: <none>
Job Priority: <none>
Output Destination: SCREEN
```

#### Storage Lifecycle Policy Management

-----

- a) Add Storage Lifecycle Policy...
- m) Modify Storage Lifecycle Policy...
- v) Modify Storage Lifecycle Policy Destinations...
- d) Delete Storage Lifecycle Policy
  
- b) Browse Storage Lifecycle Policies Forward
- r) Browse Storage Lifecycle Policies Reverse
- e) Enter Storage Lifecycle Policy
- l) List/Display Storage Lifecycle Policies
- o) Output Destination (SCREEN or FILE)
- h) Help
- q) Quit Menu

ENTER CHOICE:

### **Creating a hierarchical storage lifecycle policy using bpadm**

#### **To create a hierarchical storage lifecycle policy**

- 1** From the main bpadm NetBackup Administration menu, select:

s) Storage ...

- 2** From the Storage menu, select:

s) Storage Lifecycle Policy Management...

- 3** To create a new storage lifecycle policy from the Storage Lifecycle Policy Management menu, select:

a) Add Storage Lifecycle Policy...

- 4 The following example information is requested to create a storage lifecycle policy:

```
Adding Storage Lifecycle Policy (<ESC> to abort)
-----
Enter storage lifecycle policy name: HDTestLifecycle
Enter data classification: Gold
Enter priority of duplication jobs:  (0) 10

Add one or more storage lifecycle policy destinations
to make a valid storage lifecycle policy.
```

DRAFT

**5 To add an operation, from the Storage Lifecycle Policy Destinations menu, select:**

a) Add Storage Lifecycle Policy Destination...

bpadm asks for configuration details for the operation.

**For example:**

```
Adding Storage Lifecycle Policy Destination (<ESC> to abort)
-----
Use for
-----
0) Backup
2) Snapshot
4) Import
Enter Choice [0-2]: (0) 0
Enter Storage Unit: AdvDisk1
Enter the volume pool images should be directed to: (NetBackup)
Specific Server Group? (y/n) (n): n

Retention Type
-----
0) Fixed
1) Capacity Managed
2) Expire After Copy
3) Remote (imported) Expiration Date
Enter Choice [0-2]: (0) 0

Retention Levels
-----
0) 1 week
1) 2 weeks
2) 3 weeks
3) 1 month
4) 2 months
5) 3 months
6) 6 months
7) 9 months
8) 1 year
9) infinity
10) infinity
11) infinity
12) infinity
13) infinity
14) infinity
15) infinity
16) infinity
17) infinity
18) infinity
19) infinity
20) infinity
21) infinity
22) infinity
23) infinity
24) infinity
```

```
Enter Retention level [0-24]: (1) 2
Add Storage Lifecycle
```

- 6** Select **y** to add the first operation to the SLP. **bpadm** automatically displays the configuration details for this operation at the top of the screen:

```
Storage Lifecycle Policy:  HDTestLifecycle
Operation Index:          1
Operation Type:           backup
Storage Unit:             AdvDisk1
Volume Pool:              NetBackup
Source:                   <client>
Output Destination:       SCREEN
```

The **1** value for the Operation Index indicates the position number of the operation in the list. The source for the backup is the actual client.

- 7** To add a hierarchical operation (to use a specific source for duplication, for example), use **b** and **r** to scroll to the operation that will act as the source.

Then, select the following:

```
c) Add Operation Using Selected Destination As Source
```

If no source operation is selected, the following message appears:

```
Use browse to select a storage lifecycle policy destination.
```

## 8 bpadm asks for configuration details for the operation.

For example:

```
Adding Operation Using Destination 1
(backup:AdvDisk1) as Source (<ESC> to abort)
-----
Enter Storage Unit: AdvDisk2
Enter Volume Pool: (NetBackup)
Specific Server Group? (y/n) (n): n
Specific Alternate Read Server? (y/n) (n): n
Retention Type
-----
0) Fixed
1) Capacity Managed
2) Expire After Duplication
3) Remote (imported) Expiration Date
5) Mirror
Enter Choice [0-2]: (0) 0

Retention Levels
-----
0) 1 week 13) infinity
1) 2 weeks 14) infinity
2) 3 weeks 15) infinity
3) 1 month 16) infinity
4) 2 months 17) infinity
5) 3 months 18) infinity
6) 6 months 19) infinity
7) 9 months 20) infinity
8) 1 year 21) infinity
9) infinity 22) infinity
10) infinity 23) infinity
11) infinity 24) infinity
12) infinity
Enter Retention level [0-24]: (1) 1
Preserve multiplexing on tape destination copies? (y/n) (y): y
Add Storage Lifecycle
```

- 9
- Select **y** to add the second operation to the lifecycle. **bpadm** automatically displays the configuration details for this destination at the top of the screen:

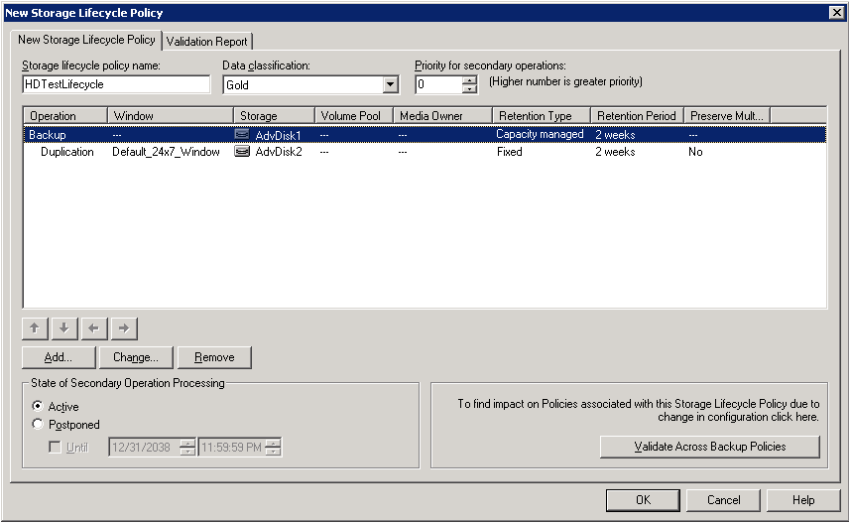

```
Storage Lifecycle Policy:  HDTestLifecycle
Operation Index:          2
Operation Type:           duplication
Storage Unit:             AdvDisk2
Volume Pool:              NetBackup
Source:                   Destination 1 (backup:AdvDisk1)
Output Destination:       SCREEN
```

The **2** value for the Operation Index indicates the position number of this operation in the SLP. The source for this duplication destination is a backup destination (AdvDisk1).

Figure 4-1 shows the hierarchy after both operations are added to the SLP.

Figure 4-1

Hierarchical storage example

# Policy Management menu

Use the **Policy Management** menu to create and manage NetBackup policies. To display the **Policy Management** menu, press **p** (Policy Management) on the **bpadm** main menu.

The **Policy Management** menu contains the following information:

```
Policy: <none>
Clients: <none>
Schedules: <none>
Output Destination: SCREEN

Policy Management
-----
a) Add Policy...
m) Modify Policy Attributes...
d) Delete Policy
s) Schedule Management...
c) Client List Management...
f) File List Management...
t) Catalog Backup Disaster Recovery...

b) Browse Policies Forward
r) Browse Policies Reverse
e) Enter Policy
l) List/Display Policies
o) Output Destination (SCREEN or FILE)
h) Help
q) Quit Menu

ENTER CHOICE:
```

## Configuring an online catalog backup

An online, hot catalog backup is policy-based, which means that it has all of the scheduling flexibility of a regular backup policy. The online catalog backup is designed for use in highly active NetBackup environments with constant backup activity and the catalog size is large.

Catalog backups are crucial to the ability to restore client data. For that reason, the process for creating an online catalog backup is described here. Create an online catalog backup as you would create a policy, from the **Policy Management** menu.

### To create an online catalog backup

- 1 From the NetBackup Administration menu, press **p** (Policy Management).
- 2 From the Policy Management menu, press **a** (Add Policy).
- 3 Provide a name for the policy. The name must be unique to the configuration and cannot contain any spaces.

- 4 Specify whether to use an existing policy as a template. You can change the new policy later. In this procedure, assume that no policy is used as a template. [1]

- 5 Select policy attribute 1) Policy Type/subtype, and enter the policy type selection:

7) NBU-Catalog

- 6 Use the following NBU-Catalog menu to change any policy attributes, if necessary:

Modify Policy Attributes (<ESC> to quit)

```
-----
1) Policy Type/subtype           : NBU-Catalog
2) Active                       : Yes
--> Collect True Image Recovery Information : Yes with move
                                         detection

--> Cross mount points           : Yes
--> Follow NFS mounts           : Yes
--> Client Compression           : No
--> Client encryption            : No
--> Allow multiple data streams  : No
--> Collect BMR information      : No
--> Maximum number of jobs per policy : 1
11) Required storage unit       :
12) Volume pool                 : CatalogBackup
13) Server group                : *ANY*
--> Granular Restore             : No
15) Keyword                     :
16) Priority as compared to other policies : 0
--> Take checkpoints            : No
18) Ignore Client Direct        : No
19) Set Policy Attributes for Snapshot Client
--> Exchange backup source      : No
--> Exchange 2010 preferred Server list :
--> Application Discovery       : No
23) Discovery Lifetime          : 0
```

NBU-Catalog policy types write to the CatalogBackup volume pool by default.

- 7 When complete, press <ESC>, and press **y** to add the policy or **n** to cancel.

- 8 To create a schedule for the policy, from the Policy Management menu, press **s** (Schedule Management).
- 9 From the Schedule Management menu, press **a** (Add Schedule).
- 10 Type a label for the schedule and press **Return**.
- 11 NBU-Catalog policy types allow the following schedule types:

```
Add Schedule (<ESC> to abort)
-----
Enter Schedule Label: full_sched
Schedule Type
-----
0) Full Backup
1) Differential Incremental Backup
2) Cumulative Incremental Backup
3) Vault Catalog Backup
Enter Choice [0-3]: (0)
```

See the *NetBackup Administrator's Guide, Volume I* for the details of adding a schedule to a policy.

## 12 Configure disaster recovery information for the NBU-Catalog policies from the **Policy Management** menu. Press **t** (Catalog Backup Disaster Recovery).

```
Policy:          catalog-backup
Modify Catalog Backup Disaster Recovery (<ESC> to quit)
-----
```

- 1) Disaster Recovery Email Address :
- 2) Disaster Recovery File Location :
- 3) User Name to Access File Location :
- 4) Password to Access File Location :
- 5) Critical policy : none

Enter Choice (choices marked "--" are unavailable) [1-5]:

The **Modify Catalog Backup Disaster Recovery** menu contains the following options:

- |   |   |
|---|---|
| 1) Disaster Recovery<br>Email Address   | <p>This option prompts the administrator to enter an email address.</p> <p>Symantec recommends that the policy is configured to send the disaster recovery information to a NetBackup administrator. This backup-specific information is sent after every online catalog backup.</p> <p>To send the information to more than one administrator, separate multiple email addresses by using a comma: email1,email2</p> <p>Make sure that email notification is enabled in the environment.</p> |
| 2) Disaster Recovery<br>File Location   | <p>This option prompts the administrator to enter the path to the directory where the disaster recovery information is to be saved. Specify an NFS share.</p> <p>Symantec recommends that the image file is saved to a network share or a removable device. Do not save the disaster recovery information to the local computer.</p>  |
| 3) User Name to Access<br>File Location | <p>This option prompts the administrator enter a user name that can access the disaster recovery file location.</p> <p>If necessary, enter the logon name that is used to access the NFS share.</p>   |

- |                                     |  |
|-------------------------------------|--|
| 4) Password to Access File Location | <p>This option prompts the administrator to enter a password for the user to access the disaster recovery file location.</p> <p>If necessary, enter the password information to access the NFS share. As it is entered, the password is viewable on the screen. Once you press <b>Return</b>, the password appears as eight asterisks.</p> |
| 5) Critical policy                  | <p>A critical policy is considered crucial to the recovery of a site in the event of a disaster. The policy must appear on the <b>Critical Policies</b> list. The list appears in the configuration for a NBU-Catalog policy on the <b>Disaster Recovery</b> tab.</p>  |

**13** Press **<ESC>**, and press **y** to modify the policy or **n** to cancel.

## Global Configuration menu

Use the **Global Configuration Attributes** menu to define aspects of NetBackup operation that are not defined elsewhere in the configuration. To display the **Global Configuration Attributes** menu, press **g** (Global Configuration...) on the **bpadm** main menu.

The Global Configuration Attributes menu contains the following information:

```

Keep Logs:      2 days
Admin Mail Address: <none>
Job Retry Delay: 10 minutes
Policy Update Interval: 10 minutes
Preprocess Interval: 4 hours (default)
Backup Tries:    2 times in 12 hours
Maximum Backup Copies: 2
Output Destination: SCREEN

```

## Global Configuration

- m) Modify Configuration Parameters...
- l) List/Display All Configuration Parameters
- o) Output Destination (SCREEN or FILE)
- h) Help
- q) Quit Menu

## Fibre Channel Transport Management menu

Use the Fibre Channel Transport Management menu to define and manage the NetBackup Fibre Channel and SAN clients. To display the Fibre Channel Transport Management menu, press **f** (Fibre Channel Transport Management) on the bpadm main menu.

The Fibre Channel Transport Management menu contains the following information:

```
Fibre Channel Transport Management
-----
```

- c) SAN Client Management ...
- s) FT Server Management ...
- d) Defaults Configuration ...
- r) FT Connection Report ...
- h) Help
- q) Quit

```
ENTER CHOICE:
```

Alternatively, you can start the Fibre Channel Transport Management utility by using the `/usr/opensv/netbackup/bin/nbftadm` command.

## Reports menu

Use the Reports menu to view problem or status reports from one or more NetBackup servers or clients. To use the Reports menu, press **r** (Reports) on the bpadm main menu.

The Reports menu contains the following information:

```
Server:  ALL
Client:  ALL
Start Date: 05/14/2011 13:58:27
End Date: 05/15/2011 23:59:59
Output Destination: SCREEN
```

```
Reports
-----
```

- b) Backup Status
- l) List Client Backups
- p) Problems
- a) All Log Entries

```
m) Media ...

d) Change Dates
c) Change Client
s) Change Server
o) Output Destination (SCREEN or FILE)
h) Help
q) Quit Menu
```

```
ENTER CHOICE:
```

## Manual Backups menu

Use the Manual Backups menu to perform a manual backup of the files that are associated with any policy, client, or schedule. Press **m** (Manual Backups) on the bpadm main menu.

The Manual Backups menu contains the following information:

```
Policy: W2
Client: <ALL>
Schedule: w2_daily_incr (Incremental)
```

```
Manual Backups
-----
```

```
i) Initiate Backup
b) Browse Policies Forward
r) Browse Policies Reverse
s) Browse Schedules
c) Browse Client Workstations
e) Enter Policy/Client/Schedule...
h) Help
q) Quit Menu
```

```
ENTER CHOICE:
```

### To perform manual backups

- 1 Press **e** (Enter Policy/Client/Schedule) and specify the policy, client, and schedule.

Or, press **b** (Browse Policies Forward) until the Policy line at the top of the screen shows the name you want.

- To select either a single client or all clients, press **c** (Browse Client Workstations). Stop when the name of a specific client (or ALL for all clients) appears on the Client line at the top of the screen.
  - To select the schedule or schedules, press **s** (Browse Schedules). Stop when the name of a specific schedule appears on the Schedule line at the top of the screen.
- 2 To start the backup, press **i** (Initiate Backup).

## Special Actions menu

Use the Special Actions menu to perform a variety of tasks that do not fall under other categories. Press **x** (Special Actions) on the bpadm main menu.

The Special Actions menu contains the following information:

```
Special Actions
-----
c)  Install All Clients...
r)  View and Change Retention Levels

i)  Initiate Request Daemon
t)  Terminate Request Daemon

h)  Help
q)  Quit Menu
```

### About the Install All Clients option

To install software on trusting clients, press **c** (Install All Clients). A trusting client is one that has an `.rhosts` file with an entry for the NetBackup server.

### Changing retention levels

To change the retention period that is associated with any retention level, press **x** (Special Actions) from the main menu. Press **r** (View and Display Retention Levels) and follow the prompts.

Level	Period	level	Period
-----	-----	-----	-----
* 0	1 week	* 1	2 weeks
* 2	3 weeks	* 3	1 month
4	2 months	5	3 months
6	6 months	7	9 months

* 8	1 year	* 9	infinity
10	infinity	11	infinity
12	infinity	13	infinity
14	infinity	15	infinity
16	infinity	17	infinity
18	infinity	19	infinity
20	infinity	21	infinity
22	infinity	23	infinity
24	infinity		

Enter 'r' to restore defaults.

'\*' indicates the retention is used in a current schedule.

Select the retention level you wish to change. (0-8, 10-24, r, q=quit, s=save)>

---

**Note:** An asterisk in front of a retention level indicates that the retention level is referenced in a currently defined schedule. If you change the retention level, it can have adverse effects on the schedules that use it.

---

## Server Group Management menu

Use the **Server Group Management** menu to define and manage server groups.

To display the **Server Group Management** menu, press **o** (**Server Group Management**) on the **bpadm main** menu.

The **Server Group** menu contains the following information:

Server Group Label: <none>  
Output Destination: SCREEN

Server Group Management

-----

- a) Add Server Group...
- m) Modify Server Group...
- d) Delete Server Group
  
- b) Browse Server Groups Forward
- r) Browse Server Groups Reverse
- e) Enter Server Group
- l) List/Display Server Groups

- o) Output Destination (SCREEN or FILE)
- h) Help
- q) Quit Menu

ENTER CHOICE:

## About the vmadm media management utility

The NetBackup `vmadm` media management utility is a character-based, menu-driven interface to add, delete, or change media in a NetBackup volume configuration. It can be used at any terminal (or terminal emulation window) for which `termcap` or `terminfo` is defined.

The NetBackup command utilities are alternatives to the **NetBackup Administration Console**. The terminology, general concepts, and results are the same regardless of which method you use.

### Starting vmadm

You must be the root user to **run** `vmadm`.

### To start vmadm

- ◆ Enter `/usr/opensv/volmgr/bin/vmadm`.

The `vmadm` main menu is similar to the following:

```
Database Host:  shark
Media Management
-----
a) Add Volumes
d) Delete Volumes
m) Move Volumes
p) Print Information about Volumes

c) Configure Volume Pools
s) Special Actions

u) Device Configuration Utility
k) Disk Configuration Utility

h) Help
q) Quit
ENTER CHOICE:
```

Specify an option by pressing the key that corresponds to the menu option. Each option displays other menus from which you make choices.

The Database Host is the host on which the EMM database resides and the Media Manager volume daemon (`vmd`) is running.

## Starting and stopping vmd

You can start and stop the Media Manager volume daemon, `vmd`.

### To start vmd from the UNIX prompt

- ◆ Enter `/usr/opensv/volmgr/bin/vmd`.

### To start vmd from vmadm

- 1 On the main menu, select **s** for Special Actions.
- 2 Select **i** for Initiate Media Manager Volume Daemon, which starts `vmd` and returns you to the **Special Actions** menu.

### To stop `vmd` from `vmadm`

- 1 On the main menu, select **s** for Special Actions.
- 2 Select **t** for Terminate Media Manager Volume Daemon. This action stops `vmd` and returns you to the **Special Actions** menu.

## About adding volumes using `vmadm`

You can add volumes automatically to the robots that support bar codes. For the robots that do not support bar codes, you can add volumes automatically but some operational limitations exist.

See "Robot attributes" in the *NetBackup Device Configuration Guide*.

The easiest way to add new media to NetBackup is as follows:

- Inject the media into the robot.
- Use auto-populate to add the volumes automatically. The `vmadm` utility updates the EMM database to agree with the contents of the robot. The database update creates the media IDs automatically.

If the robot supports bar codes and the volumes have readable barcode labels, auto-populate generates media IDs for new volumes from one of the following:

- The last six characters of the bar codes
- Media ID generation rules

When you use barcode rules, the new media that are added through a barcode rule are assigned the following: a media type, a pool name, a maximum number of mounts (or cleaning), and a description.

If the robot does not support bar codes or the media does not have readable bar codes, the new media IDs are based on a media ID prefix that you specify.

The following are prerequisites for auto-populating a robot for the following:

- Check the barcode capabilities of the robot and its media by inventorying the robot.
  - Whether the robot supports bar codes.
  - Whether the new media have readable bar codes.

See "[Inventorying robots using `vmadm`](#)" on page 131.

If the robotic library does not support bar codes or the media do not have readable bar codes, save the results of the verify operation. You can use those results if you assign a media ID prefix.

You can use the physical inventory utility for nonbarcoded media.

See the *NetBackup Administrator's Guide, Volume I*.

- Create barcode rules (optional). Create any additional barcode rules that you want to use to auto-populate the database.  
See “[Configuring barcode rules](#)” on page 135.
- For the robot types that are not API robots, create media ID generation rules (optional).
- For API robots, create media type mappings for the robot.
- See “[Changing update options](#)” on page 132.  
You can change the default media type mappings.  
See the *NetBackup Administrator’s Guide, Volume I*.
- Ensure that the appropriate control daemons are active on the robot control host.

More information about volumes is available.

See the *NetBackup Administrator’s Guide, Volume I*.

## Adding volumes using vmadm

You can add a single volume, a range of volumes, or let `vmadm` read the bar codes on the media and add them automatically.

### To add volumes

- 1 Press **a** at the **Media Management** menu.
- 2 Follow the prompts to add the following:
  - Standalone volumes (when prompted for the location, specify `Not in robotic device`)
  - Volumes to a robot (when prompted for the location, specify the robot in which the volumes reside)

## Displaying the volume configuration

You can display the volume configuration on the screen or send the output to a file.

### To display the volume configuration

- 1 Press **p** at the **Media Management** menu to display the **Display Options** menu.
- 2 To show all volumes in the configuration, press **s** at the **Display Options** menu.

Toggle between brief or full display. Send the output to the screen (the default) or write it to a file.

Filter the output by the following criteria:

- All
- Media ID
- Media type
- Volume group
- Robot number
- Robot type
- Volume pool
- Vault container ID

## Deleting volumes or groups

To delete volumes or groups

- ◆ Press **d** at the Media Management menu and then follow the prompts.

You can delete a single volume, multiple volumes, or a volume group.

If you delete multiple volumes, you enter the media IDs one at a time. After you delete all of the volumes, press Enter without entering a media ID.

## Moving volumes or a volume group

Moving volumes in `vmadm` changes only their logical residence in the EMM database. They also must be moved physically, unless they are injected or ejected by using the media access port.

You can move the following volumes:

- A single volume  
If the robot has a media access port, you can inject or eject the volume.
- Multiple volumes
- A volume group

If the robot supports bar codes and the media have readable bar codes, Symantec recommends that you inventory the robot and update the volume configuration.

See “[Inventorying robots using vmadm](#)” on page 131.

If the robot does not support bar codes or if the bar codes are unreadable, use the procedures in this topic. Alternatively, use the physical inventory utility.

See the *NetBackup Administrator's Guide, Volume I*.

An overview of how to move volumes is available.

See the *NetBackup Administrator's Guide, Volume I*.

#### To move volumes or a volume group

- 1 Press **m** at the **Media Management** menu.
- 2 Follow the prompts.

To move multiple volumes is similar to a single volume. However, after you choose where you want to move the volumes, you are prompted to continue entering media IDs of volumes to move. After you enter all of the IDs, press Enter without entering a media ID. You also do not have the option to eject and inject volumes by using the media access port.

## Changing a volume description

#### To change a volume description

- ◆ Press **s** at the **Media Management** menu and press **d** at the **Special Actions** menu. Then follow the prompts.

## Changing the volume pool of a volume

#### To change the volume pool of a volume

- 1 Press **s** at the **Media Management** menu and press **p** at the **Special Actions** menu. Then follow the prompts
- 2 At the **Volume Pool** menu, select the new volume pool for the volume. Then enter the media ID of the volume to change.
- 3 To stop changing volumes, press **Enter** at the **Enter Media ID** prompt without entering a media ID. To change another volume, enter another media ID.

## Changing the expiration date for volumes

You can change the expiration date for any volume in the EMM database. The expiration date is the age of the media, not the age of the data on the media. It is when the media is considered too old to be reliable.

#### To change the expiration date for a volume

- ◆ Press **s** at the **Media Management** menu and press **e** at the **Special Actions** menu. Then follow the prompts

When the expiration date of a volume has passed, NetBackup can still read it. However, NetBackup does not mount an expired volume for a write access.

NetBackup writes a warning message to the system console log for a read access request for an expired volume. NetBackup generates an error message for a write request to an expired volume.

Enter 0 for no expiration date or enter a date in one of the following formats:

- mm/dd/yy hh/mm/ss
- mm/dd/yyyy hh/mm/ss
- mm/dd/yy
- mm/dd/yyyy
- mm/dd

#### To stop changing volumes

- 1 Press **Enter** at the **Enter Media ID** prompt without entering a media ID.
- 2 To change another volume, enter another media ID.

## Changing the volume group for volumes

#### To change the volume group for volumes

- ◆ Press **s** at the **Media Management** menu and press **g** at the **Special Actions** menu. Then follow the prompts.

You can change one or more volumes.

#### To stop changing volumes

- ◆ Press **Enter** at the **Enter Media ID** prompt without entering a media ID. To change another volume, enter another media ID.

At the **Volume Group** menu, select the new group for the volumes or generate a new volume group for the volumes.

## Changing Vault attributes of volumes

Several volume attributes are used for the NetBackup Vault option. You can change those Vault attributes.

#### To change Vault attributes

- ◆ Press **s** at the **Media Management** menu and press **a** at the **Special Actions** menu to display the Vault Volume Parameters menu.

Press the letter key that corresponds to the attributed you want to change.

You can change one or more volumes. To change another volume, enter another media ID.

#### To stop changing volumes

- ◆ Press **Enter** at the **Enter Media ID** prompt without entering a media ID.

## Modifying the number of cleanings

You can set or change the number of cleanings that are allowed for a cleaning tape. This number is reduced with each cleaning. When it is zero, NetBackup stops using the tape. Then change the cleaning tape or increase the number of cleanings that remain.

#### To modify the number of cleanings

- ◆ Press **s** at the **Media Management** menu and press **m** at the **Special Actions** menu. Then follow the prompts.

## Updating bar codes for selected volumes in a robot

For the robots that support bar codes and have readable barcoded media, you can check the bar codes of volumes and update the EMM database.

Use this menu option only to add the bar codes that are not in the database. For example, if you add a new volume to NetBackup but do not inject it into the robot, NetBackup does not update the EMM database. In this case, you can use the **Update/Validate Barcode** option to fill in the missing barcode.

---

**Note:** You cannot use the **Update/Validate Barcodes** option for API robots because NetBackup does not manage media location information for API robots.

---

#### To update bar codes

- ◆ Press **s** at the Media Management menu and press **u** at the Special Actions menu. Then follow the prompts.

You can update one or more volumes. To update another volume, enter another media ID.

#### To stop changing volumes

- ◆ Press **Enter** at the **Enter Media ID** prompt without entering a media ID.

## Inventorying robots using vmadm

For the robots that support bar codes and have media with readable bar codes, you can inventory the media in the robot. You also can use one of the inventory options to add new media to the NetBackup configuration.

The procedure is similar for each type of inventory.

Inventory and compare operations are handled as follows:

- For API robots, NetBackup determines whether the media ID and media type that is stored in the EMM database matches the robot's database.
- For non-API robots with barcode readers, NetBackup determines whether the barcodes in the robot match those in the EMM database. When the report shows `<none>`, it means that the media does not have a barcode.
- For the robots that cannot read bar codes, `vmadm` verifies only whether the EMM database correctly shows whether a slot contains media.

See [“Changing update options”](#) on page 132.

For an inventory operation and update operation, the following update modes are available:

INTERACTIVE	Displays a list of recommended changes and prompts you to confirm whether to continue with the update.
NOT INTERACTIVE	Makes the recommended changes without prompting for a confirmation.

The **m** option of the **Inventory and Update** menu toggles the update mode.

#### To inventory a robot

- 1 On the **Media Management** menu, select **s** to display the **Special Actions** menu.
- 2 Select one of the inventory options and then select a robot.
- 3 When using ACS and TLM robots, at the Robot Control Host prompt, enter the host on which the NetBackup robotic daemon runs (`acsd` or `t1md`).
- 4 Follow the prompts.

## Changing update options

For most configurations, the default update options work well. Only change the defaults if the configuration has special hardware or usage requirements.

See [“Inventorying robots using `vmadm`”](#) on page 131.

#### To change update options

- 1 On the **Media Management** menu, select **s** to display the **Special Actions** menu.
- 2 Select one of the inventory options and then select a robot.

- 3 On the **Inventory and Update** menu, select **o** to display the **Update Options** menu.
- 4 To change an update option, select the letter key that corresponds to the option.

**Table 4-1** Update Options menu

Update Option	Description
<b>Use Barcode Rules</b>	If yes, NetBackup attempts to use barcode rules only for the volumes that are not already in the EMM database.
<b>Media type</b> if you do not use barcode rules	<p>For API robots vmadm uses the Media Type Mappings that appear. For the non-API robots that are configured on this robot host, vmadm uses the media type as follows:</p> <ul style="list-style-type: none"><li>■ If all of the drives are the same type and at least one drive is configured on the robot control host, vmadm uses the media type for the drives.</li><li>■ If all of the drives are not the same type, vmadm uses the default media type for the robotic library.</li></ul> <p>You must select a media type from the menu if in the following situations:</p> <ul style="list-style-type: none"><li>■ The robotic library supports multiple media types and you do not want the default media type.</li><li>■ The drives are not configured on the robot control host and the drives are not the default media type for the robot.</li></ul>
<b>Media type</b> if you use barcode rules	Choose DEFAULT to let the barcode rule determine the media type that is assigned. To use a media type other than the default, choose a specific type from the menu. The update media type setting always overrides barcode rules.

**Table 4-1** Update Options menu (*continued*)

Update Option	Description
<b>Media ID Prefix</b>	<p>Specify a media ID prefix if the robot does not support bar codes and the media that was inserted does not have readable bar codes.</p> <p>If neither of the previous conditions are true, a prefix is not required.</p> <p>NetBackup uses one of the following for a Media ID:</p> <ul style="list-style-type: none"> <li>■ The last six characters of the barcode.</li> <li>■ The characters that you specify if you use Media ID generation rules, whether or not a barcode rule is used.</li> </ul> <p>If you select default media ID prefix, vmadm uses the last MEDIA_ID_PREFIX entry in the <code>vm.conf</code> file. If no MEDIA_ID_PREFIX entries exist, vmadm uses the letter A as the default prefix.</p> <p>If you select use no media ID prefix, the operation succeeds only if the robot supports bar codes and the media have readable bar codes. This choice can be useful if you use media with bar codes and want updates to fail when unreadable or missing bar codes are encountered.</p>
<b>Volume group for REMOVED media</b>	<p>If Media Type is DEFAULT, you can choose from the existing volume groups that are valid for the robot's default Media Type. If Media Type is other than DEFAULT, you can choose from the existing volume groups that are valid for the media type.</p>
<b>Volume group for ADDED or MOVED media</b>	<p>If Media Type is DEFAULT, you can choose from the existing volume groups that are valid for the robot's default Media Type. If Media Type is other than DEFAULT, you can choose from the existing volume groups that are valid for the media type.</p>
<b>Volume Pool</b>	<p>If you use barcode rules, by default the volume pool setting of the barcode rule determines the volume pool that NetBackup assigns. The Update Options volume pool always overrides a barcode rule. If you do not use barcode rules, by default NetBackup does the following: Uses the NetBackup volume pool for data volumes and the None volume pool for cleaning tapes.</p>

## Configuring barcode rules

Information about barcode rules is available.

See the *NetBackup Administrator's Guide, Volume I*.

### To configure barcode rules

- 1 On the **Media Management** menu, select **s** to display the **Special Actions** menu.
- 2 Choose **b) Configure Barcode Rules** from the **Special Actions** menu.

## Configuring and managing volume pools

Additional information about volume pools is available.

See the *NetBackup Administrator's Guide, Volume I*.

See [“Volume pool and volume group examples”](#) on page 208.

### To configure and manage volume pools

- 1 To open the **Configure Volume Pools** menu, press **c** at the Media Management menu.
- 2 To add, change, or delete volume pools, press the letter key that corresponds to the menu option. Then follow the prompts.

Additional information about volume pools is available:

## About the `tpconfig` device configuration utility

The NetBackup `tpconfig` device configuration utility is a character-based, menu-driven interface to configure robots, drives, and logon credentials. It can be used at any terminal (or terminal emulation window) for which `termcap` or `terminfo` is defined.

The NetBackup command utilities are alternatives to the **NetBackup Administration Console**. The terminology, general concepts, and results are the same regardless of which method you use.

After you configure devices, you can use the Media Management utility (`vmadm`) or the **NetBackup Administration Console** to configure volumes.

The following list describes the attributes of device configuration and how to use the `tpconfig` utility to configure those attributes.

The attributes apply to UNIX systems only.

The `tpconfig` device configuration utility attributes are as follows:

### ■ Robot number

You assign a robot number when you add a robot to the configuration. `tpconfig` prompts you to enter a number or accept the next available robot number that appears. This number identifies the robot in displays and listings, and it follows the robotic type in parentheses, such as TL8(2).

The following point applies only to NetBackup Enterprise Server.

If you configure robots on multiple systems, robot numbers must be unique. If you connect drives from a robot to multiple systems, specify the same robot number for the robot on all systems.

### ■ Robotic control path

For most robots, you or the operating system creates this path in the `/dev` directory when you add a robot to the configuration. When the `tpconfig` utility prompts you, enter the path to the robotic control as found in the `/dev` directory. If the entries do not exist, more information is available.

See the *NetBackup Device Configuration Guide*.

The following point applies only to NetBackup Enterprise Server.

The control path to a robot may be on another host. If so, enter the host name of the host instead of a path. When you define a robot that another host controls by another host, the robot number must be the same on both hosts.

Information on how to configure robotic control is available.

See the appendices in the *NetBackup Device Configuration Guide*.

### ■ Host name

This topic applies to NetBackup Enterprise Server.

You must specify a host name in the following cases:

- When you add an ACS robot, enter the name of the host on which the ACS Library Software resides instead of a robotic control path.
- When you add a TLM robot, enter the DAS or Scalar DLC server name instead of a robotic control path.
- When you add one of the following robots that has robotic control on another host, you are prompted for the name of that host: TL8, TLD, or TLH robot.

### ■ No rewind on close device name

You specify a no rewind on close device name when you add a drive. Usually the letter `n` precedes or follows the device name. If the device name entries do not exist, you must create them.

See the *NetBackup Device Configuration Guide*.

In `tpconfig` displays and `tpconfig` output, the device names are shown under the heading `DrivePath`.

### ■ Drive status

Drive status indicates whether NetBackup considers a drive available. You specify the initial drive status when you add a drive to the configuration. You can change the status. To do so, use the Update option of the Drive Configuration menu in `tpconfig` (ensure that the device daemon `ltid` is not active). If the device daemon `ltid` is active, use the Administration Console Device Monitor or the `vmoprcmd` command.

## About the tpconfig utility menu

The **Device Configuration Utility** menu contains the following information:

Device Management Configuration Utility

- 1) Drive Configuration
- 2) Robot Configuration
- 3) Credentials Configuration
- 4) Print Configuration
- 5) Help
- 6) Quit

Enter option:

[Table 4-2](#) describes the main menu selections.

**Table 4-2** tpconfig main menu selections

Menu choice	Description
<b>Drive Configuration</b>	Opens a menu to add, delete, or update drive definitions; list definitions of drives and robots; or configure drive paths.
<b>Robot Configuration</b>	Opens a menu to add, delete, or update robot definitions or list definitions of drives and robots
<b>Credentials Configuration</b>	Opens a menu to add, delete, update, or list credentials for the following: <ul style="list-style-type: none"><li>■ NDMP filer</li><li>■ Disk array</li><li>■ OpenStorage server</li><li>■ Virtual machine</li></ul>

Table 4-2 tpconfig main menu selections (continued)

Menu choice	Description
Print Configuration	<p>The List Configuration commands on subsequent menus let you display the current configuration on the screen or write it to a file.</p> <p>If you specify the <code>-d</code> option only on the <code>tpconfig</code> command, <code>tpconfig</code> writes the current configuration to stdout (the screen) without invoking the menus.</p> <p>Other command options are available. Run <code>tpconfig -help</code>. See <i>NetBackup Commands Reference Guide</i>.</p>
Help	Online Help is available on the main menu and most submenus.
Quit	Terminates the utility and returns you to the UNIX prompt.

You can return to the main menu from anywhere in the utility by entering **Ctrl C** or by using the **Escape** key.

## Starting the tpconfig device configuration utility

Several methods exist to start the `tpconfig` utility.

**Note:** If the Media Manager device daemon is running, stop it by using the `stopltid` command.

### To start tpconfig from the vmadm utility

- ◆ Press **u** (Device Configuration Utility) from the `vmadm` Media Management menu.

### To start tpconfig from a UNIX shell

- ◆ Enter the following command in a UNIX shell (you must have root user privileges):

```
/usr/opensv/volmgr/bin/tpconfig
```

## Adding robots

When you configure robots and drives, first add the robots by using the **Robot Configuration** menu. Then add the drives by using the **Drive Configuration** menu.

To change standalone drives to robotic, use the **Update** option of the **Drive Configuration** menu.

See “[Updating a drive configuration](#)” on page 141.

#### To add a robot

- 1 Select the **Robot Configuration** menu.
- 2 Select the **Add** option.
- 3 From the list of possible robot types, select the one you want to add.
- 4 Enter a robot number that you know is unused or accept the default robot number.
- 5 Indicate where the robotic control for the library is by entering the device file path or library name. The **Help** option on the **Robot Configuration** menu has examples of typical path names.
- 6 The following applies only to NetBackup Enterprise Server:
  - If robotic control is on another host, enter that host name.  
For an ACS robot, enter the name of the ACS library software host. For a TLM robot, enter the name of the DAS or Scalar DLC server.
  - If robotic control is on this host, enter the device file path or library name.  
The **Help** option on the **Robot Configuration** menu has examples of typical path names.  
For an ACS robot, enter the name of the ACS library software host.  
For a TLH robot on an AIX system, enter the LMCP Device File; otherwise, enter the Automated Tape Library Name.  
For a TLM robot, enter the name of the DAS or Scalar DLC server.
- 7 If no conflicts are detected with the new configuration, a message appears to indicate that the robot was added.

## Adding drives

Use the following procedure to add a drive.

#### To add a drive

- 1 Select the **Drive Configuration** menu.
- 2 Select the **Add** option.
- 3 From the list of possible drive types, select the one you want to add.
- 4 Enter the no rewind on close device path as shown in the `/dev` directory.  
The **Help** option on the **Drive Configuration** menu has examples of typical path names.
- 5 Enter the drive status (Up or Down).

- 6 If a robot exists to which you can add the drive, specify whether to add the drive to the robot. Alternatively, you can configure the drives as a standalone drive.

If there are no robots to which you can add the drive, `tpconfig` automatically adds the drive as a standalone drive.

If you add a drive to a robot and more than one possible robot exists, enter the number of the robot that controls the drive.

Depending on the type of robot, you may also be prompted to add the robot drive number.

- 7 This step applies only to NetBackup Enterprise Server.

For a drive in an ACS robot, you are prompted for four drive identifiers.

More information on ACS robots is available.

See the *NetBackup Device Configuration Guide*.

For a drive in a TLH robot, you are prompted for an IBM device number.

For a drive in a TLM robot, you are prompted for a DAS or Scalar DLC drive name.

More information is available.

See the *NetBackup Device Configuration Guide*.

- 8 Type a drive name or press the **Enter** key to use the default drive name.

The following point applies only to NetBackup Enterprise Server.

If you use the shared drives option, all hosts that share the same physical drive must use the same name for the drive. Descriptive drive names are recommended.

## Updating a robot configuration

Use the following procedure to change the robot number or the robotic control path.

### To change the robot number or the robotic control path

- 1 On the main menu, select **Robot Configuration**.

If only one robot is configured, you do not have to select **Update** or enter the robot number. If only one robot is configured, skip to step 4.

- 2 On the **Robot Configuration** menu, choose **Update**.

- 3 Enter the number of the robotic library you want to change.

- 4 Enter a new robot number to replace the existing robot number or press **Enter** to retain the current robot number.

You are prompted to enter robotic control information. The actual prompts depend on the type of robotic library you update.

- 5 Enter the appropriate robotic control path or name of the server that hosts the robot.

## Updating a drive configuration

You can change information for a drive (for example, you can add it to a robot).

### To change information for a drive

- 1 On the main menu, select **Drive Configuration**.
- 2 On the **Drive Configuration** menu, choose **Update**.
- 3 Enter the name of the drive you want to update.

The current drive information is displayed, followed by prompts to change each field.

- 4 Enter a new value or press **Enter** to retain the existing value.

One of the prompts asks if you want to configure the drive in a robot. If you do, `tpconfig` adds the drive immediately or gives you the opportunity to choose from any existing robot of the appropriate type.

When you have responded to all prompts, a revised Drive Information display appears, along with the following prompt:

```
Are you sure you want to UPDATE drive name xxxxx? (y/n) n:
```

- 5 Answer yes by pressing **y**.

## Deleting a robot

Use the following procedure to delete a robot.

### To delete a robot

- 1 On the main menu, select **Robot Configuration**.  
If only one robot is configured, you do not have to select **Update** or enter the robot number. If only one robot is configured, skip to step 4.
- 2 On the **Robot Configuration** menu, choose **Delete**.

- 3 If more than one robot is configured, enter the number of the robot to delete.
- 4 Enter **y** to delete the robot.

If you respond with **n**, press any key to return to the **Drive Configuration** menu.

## Deleting a drive

Use the following procedure to delete a drive.

### To delete a drive

- 1 On the main menu, select **Drive Configuration**.
- 2 In the **Drive Configuration** menu, select **Delete**.
- 3 Enter the name of the drive you want to delete:
- 4 Enter **y** to delete the drive.

If you respond with **n**, press any key to return to the **Drive Configuration** menu.

## Configuring drive paths

Use the following procedures to configure and manage drive paths.

### To display the drive path menu

- 1 From the **Drive Configuration** menu, select **Drive Path Configuration**.
- 2 Enter a drive name.

### To add a drive path

- 1 Select **Add** from the **Drive Path Configuration** menu.
- 2 Enter a valid drive path.
- 3 Specify the drive status on the path.

The drive can be Up, Down, or Disabled for the path.

### To delete a drive path

- 1 Select **Delete** from the **Drive Path Configuration** menu.
- 2 Enter the drive path to delete.

### To update a drive path

- 1 Select **Update** from the **Drive Path Configuration** menu.
- 2 Enter the drive path to update.

- 3 Specify a new drive path or press **Enter** to update the status of the drive path.
- 4 A prompt similar to the following is displayed:
- 5 Enter the path status.

## Configuring host credentials

You can add, delete, update, or configure the following default host credentials:

- **NDMP filer**  
You can add the credentials for a specific filer on a specific server. You also can add credentials to be used for all NDMP Filers by all NetBackup servers.
- **Disk array**  
SharedDisk is supported on NetBackup 6.5 media servers only.
- **OpenStorage server**
- **Virtual machine**

### To configure host credentials

- 1 On the main menu, select **Credentials Configuration**.
- 2 On the credentials menu, select the type of credential you want to configure.

Please select the type of host you are trying to configure:

- 1) (N) dmp Filer
- 2) (D) isk Array Management Server
- 3) (O) penStorage Server
- 4) (V) irtual Machine

- 3 Select an option at the specific credentials menu and follow the prompts.

## Displaying and writing the device configuration

You can display or write out the current configuration from every menu in tpconfig.

### To display the configuration from the main menu

- 1 Press 4) Print Configuration.
- 2 Press **Enter**.

### To display the configuration from a submenu

- ◆ Select the `List Configuration` option by pressing the corresponding number.

#### To write the current configuration to a file

- 1 On the main menu, press 4) `Print Configuration`.
- 2 Enter the file name.

#### To write the current configuration to standard output

- ◆ Enter the following command in a UNIX shell:

```
tpconfig -d
```

## About the NetBackup Disk Configuration Utility

The NetBackup Disk Configuration Utility is a character-based, menu-driven interface that lets you configure and manage disk storage entities. Use this utility for optional NetBackup products that use disk pool storage. It can be used at any terminal (or terminal emulation window) for which `termcap` or `terminfo` is defined.

The NetBackup command utilities are alternatives to the **NetBackup Administration Console**. The terminology, general concepts, and results are the same regardless of which method you use.

After you configure the disk storage, you also can configure a disk storage unit by using a UNIX utility.

See [“Storage menu”](#) on page 107.

## About managing SharedDisk enclosures

SharedDisk is not supported in NetBackup 7.0. However, you can use NetBackup 6.5 media servers for SharedDisk.

For information about using SharedDisk, see your NetBackup 6.5 documentation.

Information about SharedDisk behavior with a NetBackup 7.0 master server is available.

See "About SharedDisk support in NetBackup 7.0 and later" in the *NetBackup Administrator's Guide, Volume I*.

## Managing OpenStorage servers and disk pools

Use the OpenStorage Disk Management menu to configure and manage disk storage for the OpenStorage Disk Storage Unit Option.

### To manage OpenStorage servers and disk pools

- 1 From the NetBackup disk configuration utility main menu, press **o** (OpenStorage Disk Management) to display the OpenStorage Disk Management menu.

The menu contains the following information:

```
OpenStorage Disk Management
```

```
-----
```

```
a)  Add Storage Server
u)  Update Storage Server
r)  Remove Storage Server
v)  View Storage Server
g)  Get Storage Server Configuration
e)  Engage Storage Server Configuration

p)  Preview Disk Volumes
n)  Create New Disk Pool

t)  Take Disk Pool Inventory
m)  Merge Two Disk Pools
c)  Change Disk Pool
s)  Change Disk Pool State
w)  Update Disk Pool Replication Properties From Storage Server
k)  Add Volumes To Disk Pool
d)  Delete Disk Pool
l)  List Disk Pools

h)  Help
q)  Quit Menu
```

```
ENTER CHOICE:
```

- 2 Select a menu option and follow the prompts to configure and manage OpenStorage.

## Managing global disk attributes

Use the Global Disk Management Attributes menu to configure and manage disk storage attributes for all disk pool features.

### To manage global disk attributes

- 1 From the NetBackup disk configuration utility main menu, press **g** (Global Disk Management Attributes) to display the Global Disk Management Attributes menu.

The menu contains the following information:

```
Global Disk Management Attributes
```

```
-----
```

```
l) List Global Disk Management Attributes
s) SharedDisk SCSI Persistent Reservation
```

```
h) Help
q) Quit Menu
```

```
ENTER CHOICE:
```

- 2 Select a menu option and follow the prompts to configure and manage attributes.

DRAFT

# Reference topics

This chapter includes the following topics:

- [Host name rules](#)
- [About reading backup images with tar](#)
- [Factors that affect backup time](#)
- [Methods for determining the NetBackup transfer rate](#)
- [NetBackup notify scripts](#)
- [Media and device management best practices](#)
- [About TapeAlert](#)
- [About tape drive cleaning](#)
- [How NetBackup selects drives](#)
- [How NetBackup reserves drives](#)
- [How NetBackup selects media](#)
- [Volume pool and volume group examples](#)
- [Media formats](#)
- [Media Manager commands](#)
- [About Tape I/O commands on UNIX](#)

## Host name rules

NetBackup uses host names to identify, communicate with, and initiate processes on NetBackup client and server computers. The correct use of host names during configuration is essential to the proper operation of NetBackup.

See [“About dynamic host name and IP addressing”](#) on page 43.

On Windows:

NetBackup uses TCP/IP host names to connect to NetBackup servers and clients. NetBackup validates its connections by performing a reverse host name lookup. That is, NetBackup determines the IP address of a connection and then uses the IP address to look up the host name with `gethostbyaddr()`. The host name and address resolution must be set up correctly in DNS, WINS, or the local `%Systemroot%\system32\drivers\etc\hosts` file (if necessary).

---

**Note:** Place the system host name and IP address in the `%Systemroot%\system32\drivers\etc\hosts` file to accelerate name lookups.

---

## How NetBackup uses host names

A major consideration is the extent to which you qualify host names. In many cases, the short host name of a computer is adequate. If the network environment contains multiple domains, qualify host names to the extent that servers and clients can identify each other in a multi-domain environment.

For example, use a name such as `mercury.bdev.null.com` or `mercury.bdev` rather than only `mercury`.

The following topics discuss how NetBackup stores and uses host names. These topics also address factors to consider when you choose host names.

---

**Note:** (On Windows) Do not change the host name of a NetBackup server. This practice is not recommended. You may need to import all previously used media to the server before you can use it under the new host name.

---

The following table discusses topics that address how NetBackup stores and uses host names.

**Table 5-1** How NetBackup stores and uses host names

Topic	Description
Server and client names on UNIX/Linux servers and clients	<p>On both UNIX/Linux servers and clients, the <code>SERVER</code> entries in the <code>bp.conf</code> file define the NetBackup servers that are allowed access. The first <code>SERVER</code> entry identifies the master server. The first <code>SERVER</code> entry indicates the server to which client requests are made. For this reason, the <code>SERVER</code> name must be one by which all clients can connect to the server.</p> <p>If more than one <code>SERVER</code> entry exists, the additional entries identify other NetBackup servers that can initiate scheduled backups on the client. The <code>bp.conf</code> file must have multiple <code>SERVER</code> entries if you configure remote media servers. The NetBackup Request daemon (<code>bprd</code>) and NetBackup Database Manager daemon (<code>bpdbm</code>) do not run on any server other than a master.</p> <p>When a client makes a list or restore request to the server, the NetBackup client name is used to determine whether to allow the operation. (The client name as specified on the client.) The client name that is used is usually the <code>CLIENT_NAME</code> from the <code>bp.conf</code> file of the client. Or, the client name can be the actual host name of the client if not in the <code>bp.conf</code> file. Alternate client restores can use the name that is specified through the user interface or with a parameter on the <code>bprestore</code> command.</p> <p>For a successful request, the client name must match the name that is specified for the client in the NetBackup configuration on the server. The only exception to this rule is if the server is configured to allow alternate client restores.</p>
Host names on Windows servers and PC clients	<p>Windows NetBackup servers and clients also have <code>SERVER</code> and <code>CLIENT_NAME</code> settings. On these systems, specify server and client settings in the NetBackup Administration Console.</p>

**Table 5-1** How NetBackup stores and uses host names (*continued*)

Topic	Description
Policy configuration	<p>(On Windows) The configured name for a client is the host name as it is added to a policy. This name is how the client is identified in the NetBackup configuration.</p> <p>(On UNIX/Linux) The configured name for a client is the host name as it is added to a policy. This name is how the client is identified in the NetBackup configuration. NetBackup also adds a <code>CLIENT_NAME</code> entry to a UNIX/Linux client's <code>bp.conf</code> file when software is first installed on the client.</p> <p>The server uses the client's configured name to connect to the client and start the processes that satisfy client requests. Always use qualified host names to add clients to a policy so that all NetBackup servers can connect to the clients.</p> <p>When a client makes a user backup, archive, or restore request to the NetBackup server, the server uses the peer name of the client. The peer name (identified from its TCP connection) is used to determine the client's configured name.</p> <p>If you add a client to more than one policy, always use the same name in all cases. If the same name is not used, the client cannot view all the files that are backed up on its behalf. In this case, file restores become complicated because both user action and administrator action is required to restore from some of the backups.</p>
Image catalog	<p>A subdirectory in the image catalog is created for a client when a backup is first created for that client. The subdirectory's name is the client's configured name.</p> <p>Every backup for a client has a separate file in this subdirectory. Each of these backup records contains the host name of the server on which the backup was written.</p>
Error catalog	<p>NetBackup uses entries in the error catalog for generating reports. These entries contain the host name of the server that generates the entry and the client's configured name, if applicable. The server host name is normally the server's short host name. (For example, <i>servername</i> instead of <i>servername.null.com</i>.)</p>
Catalog backup information	<p>This topic applies to NetBackup Enterprise Server.</p> <p>If you include a media server's catalog files in the NetBackup catalog, qualify the host name of the media server in the file path. Qualified names are necessary because they allow the master server to connect to the media server.</p>

## Updating NetBackup after changing the host name

Do not change the host name of a NetBackup server. A name change might require that all previously used media be imported to the server before the host can be used under the new name.

Use the following steps to update the NetBackup configuration if a client's host name is changed.

To update NetBackup after a master server name change      See [“To update NetBackup after a master server name change”](#) on page 151.

To update NetBackup after a client name change      See [“To update NetBackup after a client name change”](#) on page 152.

### To update NetBackup after a master server name change

- 1 On the master server, delete the client's old name from all policies where it exists and add the client's new name to those policies. You do not need to reinstall NetBackup software on the client. The client continues to have access to all previous backups.

- 2 (On UNIX/Linux) Create a symbolic link from the client's old image directory to its new image directory. For example,

```
cd /usr/openv/netbackup/db/images ln -s  
old_client_name new_client_name
```

- 3 (On Windows) Create a file named `ALTPATH` in the image catalog directory.

For example, if the client name is `client1`, the `ALTPATH` file is created in the following location:

```
Install_path\VERITAS\NetBackup\db\images\client1\  
ALTPATH
```

- 4 (On Windows) Create a directory for the new `client2` in the `\images` directory:

```
Install_path\VERITAS\NetBackup\db\images\client2
```

- 5 (On Windows) On the first line of the `client1\ALTPATH` file, specify the path to the directory for the new client. The path is the only entry in the `ALTPATH` file.

```
Install_path\VERITAS\NetBackup\db\images\client2
```

**To update NetBackup after a client name change**

- 1 On PC clients, change the client name setting either through the user interface or in a configuration file.

See the online Help in the **Backup, Archive, and Restore** client interface.

- 2 On UNIX/Linux clients, change the `CLIENT_NAME` value in the `bp.conf` file to the new name.

If users on UNIX/Linux clients have a `bp.conf` file in the `$HOME` directory, users must change `CLIENT_NAME` in that file to the new name.

## Special considerations for Domain Name Service (DNS)

In some requests to the master server, client software sends the name that it obtains through its `gethostname` library function (on Windows) or the `gethostname(2)` library function (on UNIX/Linux). If the name is unknown to the master server Domain Name Service, the master server may not be able to reply to client requests.

This possible situation depends on how the client and the server are configured. If `gethostname` on the client (on Windows) or `gethostname(2)` on the client (on UNIX/Linux) returns the host names that DNS on the master server cannot resolve, problems occur.

One possible solution is to reconfigure the client or the master server DNS hosts file. Another option is to create a special file in the `altnames` directory on the master server. The file forces the translation of NetBackup client host names.

On Windows:

```
install_path\NetBackup\db\altnames\host.xlate
```

On UNIX/Linux:

```
/usr/openv/netbackup/db/altnames/host.xlate
```

Each line in the `host.xlate` file contains three elements: a numeric key and two host names. Each line is left-justified, and a space character separates each element of the line:

```
key hostname_from_client client_as_known_by_server
```

Where

- *key* is a numeric value used by NetBackup to specify the cases where translation is to be done. Currently this value must always be 0, which indicates a configured name translation.

- *hostname\_from\_client* is the value to translate. The client name must correspond to the name that is obtained by running the client's `gethostname` (on Windows) or `gethostname(2)` (on UNIX/Linux). The value must be sent to the server in the request.
- *client\_as\_known\_by\_server* is the name to substitute for *hostname\_from\_client* for request responses. The name must match the name in the NetBackup configuration on the master server and must also be known to the master server's network services.

Consider the following example:

```
0 xxxx xxxx.eng.aaa.com
```

The line specifies that when the master server receives a request for a configured client name (numeric key 0), the name `xxxx.eng.aaa.com` always replaces `xxxx`.

The substitution resolves the problem if the following conditions are true:

- When `gethostname` (on Windows) or `gethostname(2)` (on UNIX/Linux) is run on the client, it returns `xxxx`.
- The master server's network services `gethostbyname` library function (on Windows) or `gethostbyname(2)` library function (on UNIX/Linux) did not recognize the name `xxxx`.
- The client was configured and named in the NetBackup configuration as `xxxx.eng.aaa.com`. And, this name is also known to network services on the master server.

## About reading backup images with tar

NetBackup uses a modified GNU `tar` for reading backup images. By using the modified `tar32.exe` on Windows or `tar` on UNIX/Linux, NetBackup can understand compressed files, sparse files, long pathnames, and ACL information. It offers features similar to those in `cpio`.

Although non-NetBackup versions of `tar` can be used to restore files, they provide only limited restore capabilities. You cannot use the NetBackup modified-GNU `tar` or `tar32.exe` to extract files from a NetBackup for Windows backup image.

## Consequences of using a non-NetBackup tar

Non-NetBackup versions of `tar` do not supply all of the restore capabilities that the NetBackup `/usr/openv/netbackup/bin/tar` provides. Possible problems result.

The following is a list of consequences that can occur if using a non-NetBackup `tar`:

- Compressed backups cannot be recovered.
- Multiplexed backups cannot be recovered.
- Solaris extended attributes cannot be restored to a client.
- VxFS named data streams cannot be restored to a client.
- Backups cannot be recovered that contain raw partitions. (Includes FlashBackup images.)
- NDMP client backup images cannot be restored, though NDMP vendors may have tools or the utilities that can perform a restore directly from the media.
- Non-NetBackup versions of `tar` may have trouble with sparse files and often skip sparse files.
- HP CDFs are restored with non-NetBackup versions of `tar`. The directory is no longer hidden and the name of the directory has a `+` appended to it.
- If the backup spans more than one piece of media, you must read and combine the fragments from the media to give to `tar`. To combine the fragments, the system's `dd` command may be useful.  
 Another possibility is to use `tar` on the fragments. To use `tar` on fragments can allow recovery of any file in the backup other than the one that spanned the media.  
 Some versions of the HP9000-800 `/bin/tar` command are known to give a directory checksum error for the second fragment of a backup that crossed media.
- Some versions of Solaris `tar` combine the `atime`, `mtime`, and `ctime` strings with the file name and create the file paths that are not desirable.

## Restoring files with a non-NetBackup tar (on UNIX/Linux)

This sequence assumes that the media is known to Media Manager and that the tape drive is under Media Manager control.

Before you begin, obtain the following information:

- The media ID of the tape that contains the required backup.
- The tape file number of the backup on the tape.  
 See the NetBackup **Images on Media** report for this tape.
- The tape type and density.
- The tape pool.

**To restore files with a non-NetBackup tar**

- 1 Enter the following command:

```
tpreq -m media_id -a r -d density -p poolname -f  
/tmp/tape
```

Where the following is true:

*media\_id* is the media ID of tape that contains the backup.

*density* is the density of the tape.

*poolname* is the volume pool to which the tape belongs

- 2 Enter the following command:

```
mt -f /tmp/tape rew
```

- 3 Enter the following command:

```
mt -f /tmp/tape fsf file_#
```

Where the following is true:

*file\_#* is the tape file number of the backup on tape. Determine the tape file number by checking the NetBackup Images on Media report for the tape.

- 4 Enter the following command:

```
mt -f /tmp/tape fsr
```

- 5 Enter the following command:

```
/bin/tar -tvfb /tmp/tape blocksize
```

Where the following is true:

*blocksize* is 64 (assume that the tape is written with 32K blocks)

- 6 Enter the following command:

```
tpunmount /tmp/tape
```

See [“To restore files with a non-NetBackup tar”](#) on page 155.

See [“Considerations for file restoration with a non-NetBackup tar \(on UNIX/Linux\)”](#) on page 156.

See [“About reading backup images with tar”](#) on page 153.

See [“Consequences of using a non-NetBackup tar”](#) on page 153.

See [“About the files that tar generates”](#) on page 157.

## Considerations for file restoration with a non-NetBackup tar (on UNIX/Linux)

When you restore files with a non-NetBackup tar, be aware of the following considerations:

- The file restoration procedure with a non-NetBackup tar does not apply to encrypted backups that use NetBackup Encryption. Encrypted backups are recoverable. However, the backups cannot be decrypted.
- To determine if a backup is encrypted, run `tar -t` before the recovery. The output for an encrypted backup is similar to the following example:

```
erw-r--r-- root/other Nov 14 15:59 2006 .EnCryYpTiOn.388
-rw-r--r-- root/other Oct 30 11:14 2006 /etc/group.10-30
```

Where the `e` at the beginning of line one indicates that the backup is encrypted. (Additional messages appear during recovery.)

- The file restoration procedure with a non-NetBackup tar does not work on the Solaris platform. You cannot use `/usr/sbin/tar` on Solaris to read NetBackup backups. The Solaris `tar` command uses the `ctime` and the `atime` fields differently than other `tar` commands.

When `/usr/sbin/tar` is used to restore backups, directories with large numbers are created at the top level. These directories are from the `ctime` and the `atime` fields being read as pathnames.

You can use `/usr/opensv/netbackup/bin/tar` or GNU `tar` to read the backups on Solaris platforms.

- Steps 1 and 6 from the file restoration procedure with a non-NetBackup tar are optional in a stand-alone environment. If step 1 is skipped, DOWN the drive and then substitute the `/dev` path of the drive in place of `/tmp/tape` in the other steps. Remember to UP the drive when you are done.

See “[To restore files with a non-NetBackup tar](#)” on page 155.

The following example was successful on an HP9000-800 with a DOWNed 4mm stand-alone drive and the NetBackup `tar`.

```
mt -t /dev/rmt/0hncb rew
mt -t /dev/rmt/0hncb fsf 1
mt -t /dev/rmt/0hncb fsr 1
/usr/opensv/netbackup/bin/tar tvfb /dev/rmt/0hncb 64
```

Some platforms require other options on the `tar` command. The following is required on Solaris 2.4:

```
/usr/opensv/netbackup/bin/tar -t -v -f /dev/rmt/0hncb -b 64
```

See “Consequences of using a non-NetBackup tar” on page 153.

See “About reading backup images with tar” on page 153.

See “About the files that tar generates” on page 157.

See “Restoring files with a non-NetBackup tar (on UNIX/Linux)” on page 154.

## About the files that tar generates

Any version of `tar` (including NetBackup-modified `tar`) can generate a number of files depending on the circumstances of the recovery, as the following table shows.

**Table 5-2** Files that tar generates

File	Description
<code>@@MaNgLeD.nnnn</code>	For backups containing <b>pathnames longer than 100 characters</b> , <code>tar</code> generates the files that are named <code>@@MaNgLeD.nnnn</code> that contain the actual file.
<code>@@MaNgLeD.nnnn_Rename</code>	<code>tar</code> generates another file ( <code>@@MaNgLeD.nnnn_Rename</code> ) that explains how to rename the <code>@@MaNgLeD.nnnn</code> files to return the files to the correct location.
<code>@@MaNgLeD.nnnn_Symlink</code>	For long names of symbolic links, <code>tar</code> generates the files that are named <code>@@MaNgLeD.nnnn_Symlink</code> . These files contain descriptions of the symbolic links that must be made to return a link to the correct file.
For cross-platform VxFS <b>extent</b> attribute restores, <code>tar</code> creates and stores extent attributes in <code>.ExTeNt.nnnn</code> files in the <code>root</code> directory	The files can either be deleted or read and the extent attributes regenerated by hand to the corresponding files.

## Factors that affect backup time

The amount of time that NetBackup requires to complete a backup is an important factor in setting up schedules. The importance of time is particularly true for the sites that handle large amounts of data. For example, the total backup time can exceed the time that is allotted to complete backups and interfere with normal network operations. Longer backup times also increase the possibility of a problem that disrupts the backup. The time to back up files can also give an indication of how long it may take to recover the files.

Figure 5-1 shows the major factors that affect backup time.

Figure 5-1 Backup time formula

Backup time =  $\frac{\text{Total data}}{\text{Transfer rate}}$  + Compression factor (optional) x Device delays

Total amount of data to back up

The total amount of data to back up depends on the size of the files for each client in the policy. The total amount of data also depends on whether the backup is a full backup or an incremental backup.

The implications are as follows:

- Full backups involve all the data. Therefore, a full backup usually takes longer than an incremental backup.
- Differential incremental backups include only the data that changed since the last full or incremental backup.
- Cumulative incremental backups include all the data that changed since the last full backup.

For incremental backups, the amount of data depends on the frequency with which files change. If a large number of files change frequently, incremental backups are larger.

Transfer rate

The transfer rate depends on the following factors.

Table 5-3 Transfer rate factors

Factor	Description
Speed of the backup device	Backups that are sent to tapes with a transfer rate of 800 kilobytes per second are generally faster than tapes with a transfer rate of 400 kilobytes. (Assume that other factors allow for the faster transfer rate.)
Available network bandwidth	The available bandwidth is less than the theoretical network bandwidth and depends on how much other network traffic is present. For example, multiple backups occurring on the same network compete for bandwidth.

**Table 5-3** Transfer rate factors (*continued*)

Factor	Description
Speed with which the client can process the data	The speed varies with the hardware platform and depends on the other applications that run on the platform. File size is also an important factor. Clients can process larger files faster than smaller ones. A backup for 20 files, 1 megabyte each, is faster than a backup for 20,000 files that are 1 kilobyte each.
Speed with which the server can process the data	Like client speed, server speed also varies with the hardware platform and depends on the other applications that run on the platform. The number of concurrent backups being performed also affects server speed.
Network configuration can affect performance	For example, when some machines run full-duplex and some run half-duplex in an Ethernet environment, the throughput is significantly reduced.
Compression (on UNIX/Linux)	Software compression often multiplies the backup time by a factor of two or three for a given set of data.
Device delays	<p>Device delays can be due to the following factors:</p> <ul style="list-style-type: none"> <li>■ The device may be busy or slow to load the media.</li> <li>■ The device may be slow to find the location on the media at which to start writing the backup.</li> </ul> <p>These delays can vary widely and depend on the devices and the computing environments.</p>

## Methods for determining the NetBackup transfer rate

Calculate three variations of the backup transfer rate by using NetBackup report data.

Three NetBackup transfer rates and calculation methods are available.

**Table 5-4** NetBackup transfer rates

Transfer rate	Description
Network transfer rate	<p>The network transfer rate is the rate provided in the All Log Entries report.</p> <p>The network transfer rate considers only the time it takes to transfer data over the network from client to server.</p> <p>This rate ignores the following:</p> <ul style="list-style-type: none"> <li>■ The time the device requires to load and position media before a backup.</li> <li>■ The time that the tape file requires to close and write an additional NetBackup information record to the tape.</li> </ul>
Network transfer plus end-of-backup processing rate	<p>This rate ignores the time it takes to load and position media before a backup. However, the rate does include the end-of-backup processing that is ignored in the network transfer rate. To determine this rate, use the All Log Entries report and calculate the time from the message:</p> <pre>begin writing backup id xxx</pre> <p>until the message</p> <pre>successfully wrote backup id xxx</pre> <p>To calculate the transfer rate, divide this time (in seconds) into the total bytes that are transferred. (The total bytes that are transferred is recorded in the <b>All Log Entries</b> report.)</p>
Total transfer rate	<p>This transfer rate includes the time it takes to load and position the media as well as the end-of-backup processing. Use the <b>List Client Backups</b> report to calculate the transfer rate by dividing Kilobytes by Elapsed Time (converted to seconds).</p>

On Windows, the Microsoft Windows System Monitor also displays the NetBackup transfer rate.

## Examples of reports that provide backup data to calculate transfer rates

Assume that the reports provide the following data.

Sample **All Log Entries** report:

TIME	SERVER/CLIENT	TEXT
04/28/09 23:10:37	windows giskard	begin writing backup id giskard_0767592458, fragment 1 to media id TL8033 on device 1 . . .
04/29/09 00:35:07	windows giskard	successfully wrote backup id giskard_0767592458, fragment 1, 1161824 Kbytes at 230.325 Kbytes/sec

### Sample List Client Backups Report:

Client:	giskard
Backup ID:	giskard_0767592458
Policy:	production_servers
Client Type:	Standard
Sched Label:	testing_add_files
Schedule Type:	Full
Backup Retention Level:	one week (0)
Backup Time:	04/28/09 23:07:38
Elapsed Time:	001:27:32
Expiration Time:	05/05/09 23:07:38
Compressed:	no
Kilobytes:	1161824
Number of Files:	78210

The following three rates were compiled with the backup data from the sample reports:

#### Network transfer rate:

1161824 Kbytes at 230.325 Kbytes per second

#### Network transfer plus end-of-backup processing rate:

23:10:30 - 00:35:07 = 01:24:30 = 5070 seconds

1161824 Kbytes/5070 = 229.157 Kbytes per second

#### Total transfer rate:

Elapsed time = 01:27:32 = 5252 seconds

1161824 Kbytes/5252 = 221.216 Kbytes per second

## NetBackup notify scripts

NetBackup provides scripts or batch files that can collect information and be used to notify administrators of specific events.

Many of the scripts are located in the `goodies` directory. The `\goodies` directory contains sample shell scripts to modify. The scripts in the `goodies` directory are not supported but are intended as examples to customize.

The `goodies` directory is found in the following location:

On Windows: `Install_path\VERITAS\NetBackup\bin\goodies\`

On UNIX: `/usr/opensv/netbackup/bin/goodies`

---

**Note:** Ensure that the notify scripts can be run by other administrators after modifying. To do so, run `chmod 755 script_name`, where `script_name` is the name of the script.

---

[Table 5-5](#) lists the scripts that are active on the master server.

**Table 5-5** Master server scripts

Script name and location	Description
Windows: <code>Install_path\VERITAS\NetBackup\bin\backup_notify.cmd</code> UNIX: <code>/usr/opensv/netbackup/bin/backup_notify</code>	See <a href="#">“backup_notify script”</a> on page 164.
Windows: <code>Install_path\VERITAS\NetBackup\bin\backup_exit_notify.cmd</code> UNIX: <code>/usr/opensv/netbackup/bin/backup_exit_notify</code>	See <a href="#">“backup_exit_notify”</a> on page 165.
Windows: <code>Install_path\VERITAS\NetBackup\bin\diskfull_notify.cmd</code> UNIX: <code>/usr/opensv/netbackup/bin/diskfull_notify</code>	See <a href="#">“diskfull_notify”</a> on page 176.
Windows: <code>Install_path\VERITAS\NetBackup\bin\mail_dr_info.cmd</code> UNIX: <code>/usr/opensv/netbackup/bin/mail_dr_info.sh</code> Administrators must create this file.	See <a href="#">“mail_dr_info”</a> on page 177.
Windows: <code>Install_path\VERITAS\NetBackup\bin\goodies\media_deassign_notify</code> UNIX: <code>/usr/opensv/netbackup/bin/goodies/media_deassign_notify</code>	See <a href="#">“media_deassign_notify”</a> on page 178.
Windows: <code>Install_path\VERITAS\NetBackup\bin\nbmail.cmd</code>	See <a href="#">“nbmail.cmd (on Windows)”</a> on page 179.
Windows: <code>Install_path\VERITAS\NetBackup\bin\goodies\pending_request_notify</code> UNIX: <code>/usr/opensv/netbackup/bin/goodies/pending_request_notify</code>	See <a href="#">“pending_request_notify”</a> on page 180.

**Table 5-5** Master server scripts (*continued*)

Script name and location	Description
Windows: <i>Install_path\VERITAS\NetBackup\bin\restore_notify.cmd</i> UNIX: <i>/usr/opensv/netbackup/bin/restore_notify</i>	See “ <a href="#">restore_notify</a> ” on page 181.
Windows: <i>Install_path\VERITAS\NetBackup\bin\session_notify.cmd</i> UNIX: <i>/usr/opensv/netbackup/bin/session_notify</i>	See “ <a href="#">session_notify</a> ” on page 181.
Windows: <i>Install_path\VERITAS\NetBackup\bin\session_start_notify.cmd</i> UNIX: <i>/usr/opensv/netbackup/bin/session_start_notify</i>	See “ <a href="#">session_start_notify</a> ” on page 181.
Windows: <i>Install_path\VERITAS\NetBackup\bin\userreq_notify.cmd</i> UNIX: <i>/usr/opensv/netbackup/bin/userreq_notify</i>	See “ <a href="#">userreq_notify</a> ” on page 182.
Windows: <i>Install_path\VERITAS\NetBackup\bin\goodies\parent_end_notify.cmd</i> UNIX: <i>/usr/opensv/netbackup/bin/parent_end_notify</i>	See “ <a href="#">parent_end_notify</a> ” on page 179.
Windows: <i>Install_path\VERITAS\NetBackup\bin\goodies\parent_start_notify.cmd</i> UNIX: <i>/usr/opensv/netbackup/bin/parent_start_notify</i>	See “ <a href="#">parent_start_notify</a> ” on page 180.
UNIX: <i>/usr/opensv/volmgr/bin/goodies/drive_mount_notify</i>	See “ <a href="#">drive_mount_notify (on UNIX)</a> ” on page 176.
UNIX: <i>/usr/opensv/volmgr/bin/goodies/drive_unmount_notify</i>	See “ <a href="#">drive_unmount_notify (on UNIX)</a> ” on page 177.
Windows: <i>Install_path\VERITAS\Volmgr\bin\shared_drive_notify.cmd</i> UNIX: <i>/usr/opensv/volmgr/bin/shared_drive_notify</i>	See “ <a href="#">shared_drive_notify</a> ” on page 182.

To use the client scripts, first create the script on the client.

[Table 5-6](#) lists the scripts that are active on the client.

**Table 5-6** Client scripts

Script name and location	Description
Windows: <i>Install_path\VERITAS\NetBackup\bin\goodies\bpstart_notify.bat</i>	See “ <a href="#">bpstart_notify.bat (Windows clients)</a> ” on page 168.

**Table 5-6** Client scripts (*continued*)

Script name and location	Description
UNIX: /usr/opensv/netbackup/bin/goodies/bpstart_notify	See “ <a href="#">bpstart_notify (UNIX clients)</a> ” on page 165.
Windows: <i>Install_path</i> \VERITAS\NetBackup\bin\goodies\bpnd_notify.bat	See “ <a href="#">bpnd_notify.bat (Windows clients)</a> ” on page 173.
UNIX: /usr/opensv/netbackup/bin/goodies/bpnd_notify Administrators must copy <code>bpnd_notify</code> from the master server to the client.	See “ <a href="#">bpnd_notify (UNIX clients)</a> ” on page 170.
UNIX: /usr/opensv/netbackup/bin/goodies/bpnd_notify_busy	See “ <a href="#">bpnd_notify_busy (UNIX clients)</a> ” on page 175.

Additional comments appear in the scripts.

**Note:** If you use either the `bpstart_notify` or `bpnd_notify` scripts, do not include any commands that write to `stdout`. NetBackup sends the output that is written to `stdout` to the server as part of the backup. The resulting backup can abort with an error message that pertains to block sizes.

Also, ensure that all commands in the scripts are appropriate to the client platform. For example, the `-s` parameter is invalid for the UNIX `mail` command on some UNIX platforms. Its use can cause data to be written to `stdout` or `stderr`.

## backup\_notify script

The `backup_notify.cmd` script (on Windows) and the `backup_notify` script (on UNIX) runs on the NetBackup server where the storage unit is located. It is called each time a backup is successfully written to media.

The scripts are located in the following directories:

On Windows: *Install\_path*\VERITAS\NetBackup\bin\backup\_notify.cmd

On UNIX: /usr/opensv/netbackup/bin/backup\_notify

NetBackup passes the following parameters to this script:

- The name of the program performing the backup
- The backup-image name or path

See the following Windows example:

```
backup_notify.cmd bptm host_0695316589
```

## backup\_exit\_notify

The `backup_exit_notify.cmd` script (on Windows) and the `backup_exit_notify` script (on UNIX) run on the master server. It is called to perform site-specific processing when an individual backup completes.

The scripts are located in the following directories:

On Windows: `Install_path\VERITAS\NetBackup\bin\backup_exit_notify.cmd`

On UNIX: `/usr/opensv/netbackup/bin/backup_exit_notify`

NetBackup passes the following parameters to the script:

<code>clientname</code>	Specifies the name of the client from the NetBackup catalog.
<code>polycname</code>	Specifies the policy name from the NetBackup catalog.
<code>schedname</code>	Specifies the schedule name from the NetBackup catalog.
<code>schedtype</code>	Specifies one of the following: FULL, INCR (differential incremental), CINC (cumulative incremental), UBAK, UARC
<code>exitstatus</code>	Specifies the exit code for the entire backup job.
<code>stream</code>	Specifies the backup stream number for a job. 0 = The backup job is not running multiple data streams. -1 = The job is a parent job.
<code>done_trying</code>	Specifies whether the job will retry. 0 = The job is not complete and will retry. 1 = The job is complete and will not retry. If the system is configured to make 3 attempts in 12 hours, the job could run this script up to 3 times. On the final attempt, the <code>done_trying</code> flag is set to 1. The job has either completed successfully or has failed and exhausted the number of tries.

See the following UNIX example:

```
backup_exit_notify clientname1 pol_prod sched_fulls FULL 0 -1 1  
backup_exit_notify clientname2 pol_prod sched_incr INCR 73 0 1
```

## bpstart\_notify (UNIX clients)

On UNIX clients, NetBackup calls the `bpstart_notify` script each time the client starts a backup or an archive.

---

**Note:** Ensure that this script can be run by other administrators on the client after it is modified. To do so, run `chmod 755 script_name`, where *script\_name* is the name of the script.

---

To use this script, copy the following file from the server:

```
/usr/opensv/netbackup/bin/goodies/bpstart_notify
```

Then place the script in the following location on the UNIX client:

```
/usr/opensv/netbackup/bin/
```

Modify the script and ensure that you have permission to run the script.

The `bpstart_notify` script runs each time a backup or an archive starts and initialization is completed. The script runs before the tape is positioned. This script must exit with a status of 0 for the calling program to continue and for the backup or archive to proceed. A nonzero status causes the client backup or archive to exit with a status of `bpstart_notify failed`.

If the `/usr/opensv/netbackup/bin/bpstart_notify` script exists, it runs in the foreground and the `bpbkarr` process on the client waits for it to complete before continuing. Any commands in the script that do not end with an ampersand character (&) run serially.

The server expects the client to respond with a `continue` message within the time that the `BPSTART_TIMEOUT` option specifies on the server.

The default for `BPSTART_TIMEOUT` is 300. If the script needs more time than 300 seconds, increase the value to allow more time.

NetBackup passes the following parameters to the script:

<code>clientname</code>	Specifies the name of the client from the NetBackup catalog.
<code>policyname</code>	Specifies the policy name from the NetBackup catalog.
<code>schedname</code>	Specifies the schedule name from the NetBackup catalog.
<code>schedtype</code>	Specifies one of the following: <code>FULL</code> , <code>INCR</code> (differential incremental), <code>CINC</code> (cumulative incremental), <code>UBAK</code> , <code>UARC</code>

---

**Note:** The `bpstart_notify` script also runs for NetBackup catalog backups if a `.policyname[.schedule]` is not specified.

---

For example:

```
bpstart_notify client1 pol_cd4000s sched_fulls FULL
bpstart_notify client2 pol_cd4000s sched_incrementals INCR
bpstart_notify client3 pol_cd4000s sched_fulls FULL
bpstart_notify client4 pol_cd4000s sched_user_backups UBAK
bpstart_notify client5 pol_cd4000s sched_user_archive UARC
```

To create a `bpstart_notify` script for a specific policy or policy and schedule combination, create script files with a *.policyname* or *.policyname.schedulename* suffix. The following are two examples of script names for a policy (production) that has a schedule (fulls):

```
/usr/opensv/netbackup/bin/bpstart_notify.production
/usr/opensv/netbackup/bin/bpstart_notify.production.fulls
```

The first script affects all scheduled backups in the policy that are named production. The second script affects scheduled backups in the policy that is named production only when the schedule is named fulls.

---

**Note:** For a given backup, NetBackup uses only one `bpstart_notify` script and that is the script with the most specific name. For example, if there are both `bpstart_notify.production` and `bpstart_notify.production.fulls` scripts, NetBackup uses only `bpstart_notify.production.fulls`.

---

The `bpstart_notify` script can use the following environment variables:

```
BACKUPID
UNIXBACKUPTIME
BACKUPTIME
```

The NetBackup `bbkar` process creates these variables. The following are examples of the strings that are available to the script to use to record information about a backup:

```
BACKUPID=client1_0857340526
UNIXBACKUPTIME=0857340526
BACKUPTIME=Sun Mar 2 16:08:46 2009
```

In addition, the following environment variables can be used to support multiple data streams.

**Table 5-7** Environment variables used to support multiple data streams

Environment variable	Description
STREAM_NUMBER	Specifies the stream number. The first stream from a policy, client, and schedule is 1. A 0 value indicates that multiple data streams are not enabled.
STREAM_COUNT	Specifies the total number of streams to be generated from this policy, client, and schedule.
STREAM_PID	Specifies the pid (process ID) number of bpbkar.
RESTARTED	Specifies checkpointed restarts or checkpointed backup jobs. A value of 0 indicates that the job was not resumed. (For example, upon first initiation.) A value of 1 indicates that the job was resumed.

## bpstart\_notify.bat (Windows clients)

For all Windows clients, you can create batch scripts that provide notification whenever the client starts a backup or archive.

To use this script, copy the following file from the server:

On Windows:

```
Install_path\VERITAS\NetBackup\bin\goodies\bpstart_notify.bat
```

Then place the file on the client in the same directory as the NetBackup client binaries:

```
Install_path\NetBackup\bin\
```

Where *Install\_path* is the directory where NetBackup is installed.

You can create bpstart\_notify scripts that provide notification for all backups or for backups of a specific policy or schedule.

To create a script that applies to all backups, name the script bpstart\_notify.bat.

To create a bpstart\_notify script that applies only to a specific policy or policy and schedule combination, add a .*policyname* or .*policyname.schedule* suffix to the script name.

The following are examples of bpstart\_notify script names:

- The following script applies only to a policy named days:

```
install_path\netbackup\bin\bpstart_notify.days.bat
```

- The following script applies only to a schedule that is named fulls in a policy named days:

```
install_path\netbackup\bin\bpstart_notify.days.fulls.bat
```

The `bpstart_notify` script also runs for NetBackup catalog backups if a `.policyname[.schedule]` is not specified.

The first script affects all scheduled backups in the policy named `days`. The second script affects scheduled backups in the policy named `days` only when the schedule is named `fulls`.

For a given backup, NetBackup calls only one `bpstart_notify` script and checks for them in the following order:

```
bpstart_notify.policy.schedule.bat  
bpstart_notify.policy.bat  
bpstart_notify.bat
```

For example, if there are both `bpstart_notify.policy.bat` and `bpstart_notify.policy.schedule.bat` scripts, NetBackup uses only the `bpstart_notify.policy.schedule.bat` script.

---

**Note:** `bpend_notify` scripts can provide a different level of notification than the `bpstart_notify` scripts. For example, to use one of each, the script names might be `bpstart_notify.policy.bat` and `bpend_notify.policy.schedule.bat`.

---

NetBackup passes the following parameters to the script:

- %1      Specifies the name of the client from the NetBackup catalog.
- %2      Specifies the policy name from the NetBackup catalog.
- %3      Specifies the schedule name from the NetBackup catalog.
- %4      Specifies one of the following: `FULL`, `INCR`, `CINC`, `UBAK`, `UARC`
- %5      Specifies that the status of the operation is always 0 for `bpstart_notify`.

%6 Specifies the results file that NetBackup checks for a return code from the script. NetBackup uses %6 to pass the file name and then expects the script to create the file in the same directory as the script.

If the script applies to a specific policy and schedule, the results file must be named

`install_path\netbackup\bin\BPSTART_RES.policy.schedule`

If the script applies to a specific policy, the results file must be named

`install_path\netbackup\bin\BPSTART_RES.policy`

If the script applies to all backups, the results file must be named

`install_path\netbackup\bin\BPSTART_RES`

An echo 0> %6 statement is one way for the script to create the file.

NetBackup deletes the existing results file before it calls the script. After the script runs, NetBackup checks the new results file for the status. The status must be 0 for the script to be considered successful. If the results file does not exist, NetBackup assumes that the script was successful.

The server expects the client to respond with a continue message within the time that the NetBackup BPSTART\_TIMEOUT option specifies. The default for BPSTART\_TIMEOUT is 300. If the script needs more than 300 seconds, increase the value to allow more time.

For Windows 2000 clients, bpstart\_notify script can use the following environment variables for the support of multiple data streams.

Table 5-8 Environment variables that support multiple data streams

Environment variable	Description
STREAM_NUMBER	Specifies the stream number. The first stream from a policy, client, and schedule is 1. A 0 value indicates that multiple data streams are not enabled.
STREAM_COUNT	Specifies the total number of streams to be generated from this policy, client, and schedule.
STREAM_PID	Specifies the pid (process ID) number of bpbkar.

## bpend\_notify (UNIX clients)

To receive a notification whenever a UNIX client completes a backup or an archive operation, copy the following file from the server:

On Windows:

```
Install_path\VERITAS\NetBackup\bin\goodies\bpend_notify
```

On UNIX:

```
/usr/opensv/netbackup/bin/goodies/bpend_notify
```

Then place the file in the following location on the UNIX client:

```
/usr/opensv/netbackup/bin/bpend_notify
```

Modify the script and ensure that you have permission to run the script.

---

**Note:** The `bpend_notify` script is run when the client is finished sending data, but the server has not yet completed writing to media.

---

---

**Note:** On Windows, ensure that this script can be run by other administrators on the client after it is modified. To do so, run `chmod 755 script_name`, where *script\_name* is the name of the script.

---

The `bpend_notify` script runs each time a backup or archive completes. For archives, it runs after the backup but before the files are removed.

If `bpend_notify` exists, it runs in the foreground and `bpbkar` on the client waits until it completes. Any commands that do not end with an ampersand character (&) run serially.

The server expects the client to respond within the time that the `BPEND_TIMEOUT` NetBackup configuration option specifies. The default for `BPEND_TIMEOUT` is 300.

If the script needs more than 300 seconds, set `BPEND_TIMEOUT` to a larger value. Avoid too large a value because it can delay the server from servicing other clients.

NetBackup passes the following parameters to the script:

<code>clientname</code>	Specifies the name of the client from the NetBackup catalog.
<code>policyname</code>	Specifies the policy name from the NetBackup catalog.
<code>schedname</code>	Specifies the schedule name from the NetBackup catalog.
<code>schedtype</code>	Specifies one of the following: <code>FULL</code> , <code>INCR</code> (differential incremental), <code>CINC</code> (cumulative incremental), <code>UBAK</code> , <code>UARC</code>

`exitstatus` Specifies the exit code from `bpbkar`. The status is the client status and does not indicate that the backup is complete and successful.

The client can display a status 0 when, due to a failure on the server, the All Log Entries report displays a status 84.

---

**Note:** The `bpend_notify` script also runs for NetBackup catalog backups if a `.policyname[.schedule]` is not specified.

---

For example:

```
bpend_notify client1 pol_1 fulls FULL 0
bpend_notify client2 pol_1 incrementals INCR 73
```

To create a `bpend_notify` script for a specific policy or policy and schedule combination, create script files with a `.policyname` or `.policyname.schedule` suffix. The following are two examples of script names for a policy that is named `production` with a schedule that is named `fulls`:

```
/usr/opensv/netbackup/bin/bpend_notify.production
/usr/opensv/netbackup/bin/bpend_notify.production.fulls
```

The first script affects all scheduled backups in the policy `production`. The second script affects scheduled backups in the policy `production` only when the schedule is named `fulls`.

---

**Note:** For a given backup, NetBackup uses only one `bpend_notify` script and that is the one with the most specific name. For example, if there are both `bpend_notify.production` and `bpend_notify.production.fulls` scripts, NetBackup uses only `bpend_notify.production.fulls`.

---

The `bpend_notify` script can use the following environment variables:

```
BACKUPID
UNIXBACKUPTIME
BACKUPTIME
```

The NetBackup `bpbkar` process creates these variables. The following are examples of the strings that are available to the script for use to record information about a backup:

```
BACKUPID=client1_0857340526
UNIXBACKUPTIME=0857340526
BACKUPTIME=Sun Mar 2 16:08:46 2011
```

The following environment variables can be used for the support of multiple data streams.

**Table 5-9** Environment variables used for support of multiple data streams

Environment variable	Description
STREAM_NUMBER	Specifies the stream number. The first stream from a policy, client, and schedule is 1. A 0 value indicates that multiple data streams are not enabled.
STREAM_COUNT	Specifies the total number of streams to be generated from this policy, client, and schedule.
STREAM_PID	Specifies the pid (process ID) number of bpbkar.
FINISHED	Specifies the status of the checkpointed restarts of backup jobs. A value of 0 indicates that the client was not finished sending all of the data. A value of 1 indicates that the client was finished sending all the of data.

## bpend\_notify.bat (Windows clients)

For Windows clients, you can create batch scripts that provide notification whenever the client completes a backup or archive. These scripts must reside on the client and in the same directory as the NetBackup client binaries:

*Install\_path*\NetBackup\bin\bpend\_notify.bat

*Install\_path* is the directory where NetBackup is installed.

You can create bpend\_notify scripts that provide notification for all backups or for backups of a specific policy or schedule.

To create a bpend\_notify script that applies to all backups, name the script bpend\_notify.bat

To create a script that applies only to a specific policy or policy and schedule combination, add a .*policyname* or .*policyname.schedulename* suffix to the script name as follows:

- The following script applies only to a policy named days:

*Install\_path*\netbackup\bin\bpend\_notify.days.bat

- The following script applies only to a schedule that is named fulls in a policy named days:

*Install\_path*\netbackup\bin\bpend\_notify.days.fulls.bat

---

**Note:** The `bpend_notify` script also runs for NetBackup catalog backups if a `.policyname[.schedule]` is not specified.

---

The first script affects all scheduled backups in the policy named `days`. The second script affects scheduled backups in the policy named `days` only when the schedule is named `fulls`.

For a given backup, NetBackup calls only one `bpend_notify` script and checks for them in the following order:

```
bpend_notify.policy.schedule.bat  
bpend_notify.policy.bat  
bpend_notify.bat
```

For example, if there are both `bpend_notify.policy.bat` and `bpend_notify.policy.schedule.bat` scripts, NetBackup uses only `bpend_notify.policy.schedule.bat`.

---

**Note:** `bpstart_notify` scripts can provide a different level of notification than the `bpend_notify` scripts. For example, if you had one of each, they could be `bpstart_notify.policy.bat` and `bpend_notify.policy.schedule.bat`.

---

NetBackup passes the following parameters to the script when the backup completes:

- %1 Specifies the name of the client from the NetBackup catalog.
- %2 Specifies the policy name from the NetBackup catalog.
- %3 Specifies the schedule name from the NetBackup catalog.
- %4 Specifies one of the following: `FULL`, `INCR`, `CINC`, `UBAK`, `UARC`
- %5 Specifies the status of the operation. It is the same status as is sent to the NetBackup server. The status is 0 for successful backups and 1 for partially successful backups. If an error occurs, the status is the value associated with that error.

%6 Specifies the results file that NetBackup checks for a return code from the script. NetBackup uses %6 to pass the file name and then expects the script to create the file in the same directory as the script.

If the script applies to a specific policy and schedule, the results file must be named

*Install\_path\netbackup\bin\BPEND\_RES.policy.schedule*

If the script applies to a specific policy, the results file must be named

*Install\_path\netbackup\bin\BPEND\_RES.policy*

If the script applies to all backups, the results file must be named

*Install\_path\netbackup\bin\BPEND\_RES*

An echo 0> %6 statement is one way for the script to create the file.

NetBackup deletes the existing results file before it calls the script. After the script runs, NetBackup checks the new results file for the status. The status must be 0 for the script to be considered successful. If the results file does not exist, NetBackup assumes that the script was successful.

The server expects the client to respond with a continue message within the time that the BPEND\_TIMEOUT option specifies. The default for BPEND\_TIMEOUT is 300. If the script needs more than 300 seconds, increase the value to allow more time.

For Windows 2000 clients, the bpend\_notify script can use the following environment variables for the support of multiple data streams.

**Table 5-10** Environment variables for support of multiple data streams

Environment variable	Description
STREAM_NUMBER	Specifies the stream number. The first stream from a policy, client, and schedule is 1. A 0 value indicates that multiple data streams are not enabled.
STREAM_COUNT	Specifies the total number of streams to be generated from this policy, client, and schedule.
STREAM_PID	Specifies the pid (process ID) number of bpbkar.

## bpend\_notify\_busy (UNIX clients)

Use the bpend\_notify\_busy script to configure busy file processing when using the bp.conf file.

See [“About busy file processing on UNIX clients”](#) on page 52.

Busy file processing can also be configured in the **Busy File Settings** host properties of the **NetBackup Administration Console**.

## diskfull\_notify

The `diskfull_notify.cmd` script (on Windows) and the `diskfull_notify` script (on UNIX) run on the NetBackup server that contains the storage unit. The disk media manager (`bpdm`) calls this script if it encounters a disk full condition while it writes a backup to a disk storage unit. The default action is to report the condition and immediately try to write the data again. (The file being written is kept open by the active `bpdm`).

The scripts are located in the following directories:

On Windows: `Install_path\VERITAS\NetBackup\bin\diskfull_notify.cmd`

On UNIX: `/usr/openv/netbackup/bin/diskfull_notify`

The script can be modified to send a notification to an email address or modified to perform actions such as removing other files in the affected directory or file system.

NetBackup passes the following parameters to the script:

<code>programname</code>	Specifies the name of the program (always <code>bpdm</code> ).
<code>pathname</code>	Specifies the path to the file being written.

For example:

```
/disk1/images/host_08193531_c1_F1
```

See the following Windows example:

```
diskfull_notify.cmd bpdm
```

## drive\_mount\_notify (on UNIX)

The NetBackup `tpreq` command runs the `drive_mount_notify` script (if it exists) immediately after media is mounted in a pre-selected, robotic drive. This script is not valid for standalone drives.

Each time a tape volume is mounted, this script gathers information on the drive that is mounted. This script also lets you perform special-handling. For example, you can use the script to gather log sense or other data from a drive and place it in an output file. You can change the information that the script gathers by modifying the script.

After the script runs, control is then returned to NetBackup to resume processing.

This script is located in the following directory:

```
/usr/opensv/volmgr/bin/goodies
```

To use this script, activate it and place it into the `/usr/opensv/volmgr/bin` directory. See the script for instructions about how to activate it and how to modify it.

See [“About requesting tapes”](#) on page 218.

## drive\_unmount\_notify (on UNIX)

The NetBackup `tpunmount` command runs the `drive_unmount_notify` script (if it exists) after media is unmounted. This script is valid for robotic drives and standalone drives.

Each time a tape volume is unmounted, this script gathers information about the drive that is unmounted. This script also lets you perform special-handling. For example, you can use the script to gather log sense or other data from a drive and place it in an output file. You can change the information that the script gathers by modifying the script.

After the script runs, control is then returned to NetBackup to resume processing.

This script is located in the following directory:

```
/usr/opensv/volmgr/bin/goodies
```

To use this script, activate it and place it into the `/usr/opensv/volmgr/bin` directory. See the script for instructions about how to activate it and how to modify it.

## mail\_dr\_info

Use the `mail_dr_info.cmd` script (on Windows) and the `mail_dr_info.sh` script (on UNIX) to send NetBackup disaster recovery information to specified recipients after running an online, hot catalog backup.

On Windows: To create the script, copy the following script from the master server:

```
Install_path\VERITAS\NetBackup\bin\nbmail.cmd
```

and place it into the following location:

```
Install_path\NetBackup\bin\mail_dr_info.cmd.
```

On UNIX: To create the script, touch the following file:

`/usr/openv/netbackup/bin/mail_dr_info.sh`

NetBackup passes the following parameters to the script:

- %1       Specifies the recipient's address. For multiple addresses, enter *email1,email2*
- %2       Specifies the subject line.
- %3       Specifies the message file name.
- %4       Specifies the attached file name.

On Windows: NetBackup checks to see if `mail_dr_info.cmd` is present in `Install_path\NetBackup\bin`. If `mail_dr_info.cmd` exists, NetBackup passes the parameters to the script.

---

**Note:** All NetBackup email notifications require that a public domain SMTP mail client be configured. (For example, blat.) For details, see the comments in the `nbmail.cmd` script.

---

On UNIX: NetBackup checks to see if `mail_dr_info.sh` is present in `/usr/openv/netbackup/bin`. If `mail_dr_info.cmd` exists, NetBackup passes the parameters to the script. `mail_dr_info.sh` is not an installed file. Users must create the script.

## media\_deassign\_notify

The NetBackup Media Manager calls the `media_deassign_notify` script after media is deassigned. To send an email notification when media is deassigned, include an email address in the script where indicated. (The script must be run as the root user.)

On Windows: Copy

`Install_path\NetBackup\bin\goodies\media_deassign_notify.cmd` into `Install_path\NetBackup\bin\` on the EMM server. (Usually the master server.)

On UNIX: Copy `/usr/openv/netbackup/bin/goodies/media_deassign_notify` into `/usr/openv/netbackup/bin/` on the EMM server. (Usually the master server.)

If the script exists in the `\bin` directory, the following parameters are passed to the script: media ID, legacy media type, barcode, robot number, and robot type.

## nbmail.cmd (on Windows)

Use the `nbmail.cmd` script to send the specified recipients notifications about scheduled backups. The recipients' email addresses must also be configured in the **Universal Settings** host properties.

Windows systems also require that you install the Simple Mail Transfer Protocol application to transfer messages in order to accept script parameters. UNIX platforms have a built-in SMTP transfer method.

To create the script on a client, copy

`Install_path\VERITAS\NetBackup\bin\goodies\nbmail.cmd` from the master server into `Install_path\NetBackup\bin` of each client that is to receive the notification.

NetBackup passes the following parameters to the script:

- %1      Specifies the address of the recipient. For multiple addresses, enter *email1,email2*
- %2      Specifies the contents of the subject line.
- %3      Specifies the file that is sent in the body of the email. This is generated by another script.
- %4      Specifies the attached file name.

NetBackup checks to see if `nbmail.cmd` is present in `Install_path\NetBackup\bin`. If `nbmail.cmd` exists, NetBackup passes the parameters to the script.

## parent\_end\_notify

NetBackup calls the `parent_end_notify.cmd` script (on Windows) and the `parent_end_notify` script (on UNIX) each time a parent job ends.

NetBackup passes the following parameters to the script:

- `clientname`      Specifies the name of the client from the NetBackup catalog.
- `policyname`      Specifies the policy name from the NetBackup catalog.
- `schedname`      Specifies the schedule name from the NetBackup catalog.
- `schedtype`      Specifies one of the following: `FULL`, `INCR` (differential incremental), `CINC` (cumulative incremental), `UBAK`, `UARC`
- `status`          Specifies the exit code for the entire backup job.
- `stream`          Specifies the stream number; it is always -1.

<code>stream_count</code>	Specifies that if the job starts normally, the stream count indicates how many streams were started.  Verifies the number of streams that complete and run <code>backup_exit_notify</code> . If a failure occurs that makes it impossible to start any streams, a stream count of -1 is returned.
---------------------------	---

## parent\_start\_notify

NetBackup calls the `parent_start_notify.cmd` script (on Windows) or the `parent_start_notify` script (on UNIX) each time a parent job starts.

NetBackup passes the following parameters to the script:

<code>clientname</code>	Specifies the name of the client from the NetBackup catalog.
<code>policyname</code>	Specifies the policy name from the NetBackup catalog.
<code>schedname</code>	Specifies the schedule name from the NetBackup catalog.
<code>schedtype</code>	Specifies one of the following: FULL, INCR (differential incremental), CINC (cumulative incremental), UBAK, UARC
<code>status</code>	Specifies the exit code for the entire backup job.
<code>streamnumber</code>	Specifies the stream number; for a parent job it is always -1.

## pending\_request\_notify

The NetBackup Media Manager calls the `pending_request_notify` script after a pending request is issued for a media resource (tape volume). To send an email notification when a pending request is initiated, include an email address in the script where indicated. (The script must be run by the root user.)

On Windows: Copy

`Install_path\NetBackup\bin\goodies\pending_request_notify.cmd` into `Install_path\NetBackup\bin\` on the EMM server. (Usually the master server.)

On UNIX: Copy `/usr/opensv/netbackup/bin/goodies/pending_request_notify` into `/usr/opensv/netbackup/bin/` on the EMM server. (Usually the master server.)

If the script exists in the `/bin` directory, the following parameters are passed to the script: media ID, barcode, action code, robot type, robot number, media server, volume group, and pending time (in seconds since the UNIX epoch).

## restore\_notify

The `restore_notify.cmd` script (on Windows) and the `restore_notify` script (on UNIX) run on the server that contains the storage unit. The NetBackup tape or disk manager (`bptm` or `bpdm`) calls the script when it finishes sending data to the client during a restore. The script is called regardless of whether data is sent.

The scripts are located in the following directories:

On Windows: *Install\_path*\VERITAS\NetBackup\bin\restore\_notify.cmd

On UNIX: */usr/opensv/netbackup/bin/restore\_notify*

NetBackup passes the following parameters to the script:

<code>programname</code>	Specifies the name of the program doing the restore or other read operation.
<code>pathname</code>	Specifies the path to the backup name or path.
<code>operation</code>	Specifies one of the following: <code>restore</code> , <code>verify</code> , <code>duplication</code> , <code>import</code>

## session\_notify

The `session_notify.cmd` script (on Windows) and the `session_notify` script (on UNIX) run on the master server. It is called at the end of a backup session if at least one scheduled backup succeeded. NetBackup passes no parameters to this script. Scheduling is suspended until this script completes, so no other backups can start until that time.

The scripts are located in the following directories:

On Windows: *Install\_path*\VERITAS\NetBackup\bin\session\_notify.cmd

On UNIX: */usr/opensv/netbackup/bin/session\_notify*

## session\_start\_notify

The `session_start_notify.cmd` script (on Windows) and the `session_start_notify` script (on UNIX) run on the master server. When a set of backups is due to run, NetBackup calls this script to do any site-specific processing before it starts the first backup. NetBackup passes no parameters to this script.

The scripts are located in the following directories:

On Windows: *Install\_path*\VERITAS\NetBackup\bin\session\_start\_notify.cmd

On UNIX: */usr/opensv/netbackup/bin/session\_start\_notify*

## shared\_drive\_notify

NetBackup runs the `shared_drive_notify.cmd` script (on Windows) and the `shared_drive_notify` script (on UNIX) when a shared drive is reserved or released.

- The name of the shared drive.
- The name of the current scan host.
- The operation, which is one of the following:

RESERVED	Specifies that the host on which the script is executed needs SCSI access to the drive until it is released.
ASSIGNED	Informational only. Specifies that the host that reserved the drive needs SCSI access.
RELEASED	Specifies that only the scan host needs SCSI access to the drive.
SCANHOST	Specifies that the host that executes the script has become the scan host. A host should not become a scan host while the drive is RESERVED.  The scan host may change between a RESERVED operation and a RELEASED operation.

The scripts are located in the following directories:

On Windows: `Install_path\VERITAS\Volmgr\bin\shared_drive_notify.cmd`

On UNIX: `/usr/opensv/volmgr/bin/shared_drive_notify`

The script must be executable by the root user.

The script exits with status 0 upon successful completion.

## userreq\_notify

The `userreq_notify.cmd` script (on Windows) and the `userreq_notify` script (on UNIX) run on the master server.

The scripts are located in the following directories:

On Windows: `Install_path\VERITAS\NetBackup\bin\userreq_notify.cmd`

On UNIX: `/usr/opensv/netbackup/bin/userreq_notify`

NetBackup calls the script each time a request is made to either of the following:

- List files that are in backups or archives
- Start a backup, archive, or restore

You can change this script to gather information about user requests to NetBackup. NetBackup passes the following parameters to the script:

action	Specifies the action and can have the following values: backup, archive, manual_backup, restore, list
clientname	Specifies the client name.
userid	Specifies the user ID.

See the following UNIX example:

```
userreq_notif backup mercury jdoe
userreq_notify archive mercury jdoe
userreq_notify manual_backup mercury jdoe
userreq_notify restore mercury jdoe
userreq_notify list mercury jdoe
```

## Media and device management best practices

Use the following best practices for NetBackup media and device management. Follow these recommendations to minimize problems and to reduce the time and the effort that is required to administer the configuration.

For a list of supported devices, server platforms, and the latest device mapping file, see the NetBackup support Web site:

<http://entsupport.symantec.com>.

The following items are general best practices for media and device management:

- Use only the NetBackup commands that Symantec documents and supports.
- Refer to the NetBackup release notes for configuration and operational changes in the current release or in future releases. The release notes also contain information about all new functionality in each release.
- Use the documented methods for terminating the NetBackup Media Manager daemons and services.
- Periodically verify the backups by using **NetBackup Management > Catalog** in the **NetBackup Administration Console**. Also, periodically restore the files to prove that restores work correctly.
- Always back up the NetBackup catalogs. You may also want to back up the `vm.conf` file and the `bp.conf` (UNIX system) files on the media servers.

- When you restore the NetBackup catalog (for example, master server databases and the EMM database), use backups from the same point in time.
- Ensure that all names and numbers for devices and all media IDs and bar codes are unique across the entire enterprise.
- On UNIX: To use the devices that NetBackup controls but are used with other applications, do the following to avoid the potential loss of data:
  - Use the NetBackup `tpreq` command to mount media on a drive and `tpunmount` to remove media from the drive. If you use these commands, another application can control a device when NetBackup is finished with the device.
  - Down the drive, if the drive is in the UP state.
- (On Windows) To use the devices that NetBackup controls but are used with other applications, down the drive if the drive is in the UP state.

## Media management best practices

The following items are NetBackup media management best practices:

- Use the robot inventory update operation for media management.
- Use a scratch pool for unassigned media.
- Configure cleaning cartridges for tape drives and use TapeAlert for automatic drive cleaning if the drives support automatic cleaning.
- Replace old media according to the life-span recommendations of the manufacturer. Replace old cleaning media also.
- Use the robotic libraries that have a bar code reader and use only the bar code labels that the robot vendor recommends.
- Use bar code rules for media type assignment when you inventory multimedia libraries. Use bar code naming conventions to differentiate between data and cleaning tapes and different physical media types. A common convention is a prefix that identifies the type of media.
- Before performing inject or eject commands, ensure that the media access port is empty. Although NetBackup can handle a port that is not empty, some libraries can have problems.

## Device management best practices

The following items are device management best practices:

- Monitor the NetBackup system log for device errors encountered.

- Monitor devices by using the NetBackup Device Monitor.
- Investigate the causes of all the drives that are down.
- Do not use the robotic test utilities while running backup or restore jobs.
- Read the *NetBackup Device Configuration Guide* before configuring devices on media servers (or SAN media servers).
- Use only computers, operating systems and devices that Symantec supports. For supported devices, see the NetBackup hardware compatibility list on the NetBackup support site.
- Use only fully-serialized devices. A fully-serialized SCSI library should report a serial number for the robot and also a serial number for each drive in the robot.
- Always configure and use pass-through paths for robotic libraries and drives.
- When possible, use SCSI persistent reserve or SCSI reserve and release.
- Use persistent bindings for fibre-attached devices.
- Use the **NetBackup Device Configuration Wizard** to configure the devices.
- Download and install the latest device mapping file from the NetBackup support Web site before you use the **NetBackup Device Configuration Wizard**.
- Use consistent logical drive types for all physical drive types on all servers in the environment. For example, use the DLT drive type as the logical drive type for all DLT7000 drives.
- Do not load vendor medium-changer drivers on Microsoft Windows hosts. The default Microsoft medium-changer driver is acceptable (but is not required) for use with NetBackup.

## Media and device performance and troubleshooting

The following items are performance and troubleshooting best practices:

- Use the performance-tuning documents available on the NetBackup support Web page.
- Use only a dedicated server for the NetBackup master server and Enterprise Media Manager (EMM) server. Do not use a server that hosts other applications or one that stores data. Plan periodic maintenance for all of the backup servers.
- Consult the Troubleshooter in the **NetBackup Administration Console** or the *NetBackup Troubleshooting Guide* for all error conditions.
- Always install the latest NetBackup release updates that are available from Symantec.

- Verify all SCSI-related operating system configuration files (such as the Solaris `st.conf` file), when you install system release updates.
- For problems with devices, consult the vendor for firmware upgrades and consult the NetBackup hardware compatibility list for supported firmware levels.
- Do not use the NetBackup `DISABLE_RESOURCES_BUSY` touch file.
- Do not disable the operating system `TCP_NODELAY` functionality.

## About TapeAlert

TapeAlert is a tape drive status monitor and message utility. The TapeAlert utility can detect tape quality problems, defects in tape drive hardware, and the need to clean drives. For the tape drives that support TapeAlert, the TapeAlert firmware monitors the drive hardware and the media. Error, warning, and informational states are logged on a TapeAlert log page.

For the drives that do not support TapeAlert, configure and use frequency-based cleaning.

See [“About frequency-based cleaning”](#) on page 191.

## About TapeAlert cleaning (reactive cleaning)

Reactive cleaning by using TapeAlert is a function of the tape drive. The drive determines and initiates the cleaning when needed. If a drive supports the TapeAlert capability and it is enabled on the drive, the NetBackup `bptm` process polls the drive for status from TapeAlert.

TapeAlert allows reactive cleaning for most drive types. Not all platforms, robots, drives, or firmware levels support tape alert reactive cleaning.

A drive with TapeAlert capability tracks how many read and write errors it has encountered within a certain time period. Although a drive can recover from these errors, the drive sets a `CLEAN_NOW` or `CLEAN_PERIODIC` flag when a threshold is reached.

If the `bptm` process detects that either of the following flags are set, it performs a cleaning at one of the following times:

- At the end of a backup or a restore to the drive.
- Before the next backup or restore to the drive.

Symantec recommends that you use reactive cleaning.

## About TapeAlert and frequency-based cleaning

Using TapeAlert with frequency-based cleaning ensures that a drive is cleaned at least every  $x$  hours, depending on the setting for the cleaning frequency. In addition, the drive can be cleaned sooner if the drive sets the CLEAN\_NOW or CLEAN\_PERIODIC TapeAlert flag.

When TapeAlert is used without frequency-based cleaning, a drive is cleaned only when the drive sets its CLEAN\_NOW or CLEAN\_PERIODIC flags.

## About TapeAlert requirements

To use TapeAlert, all of the following conditions must be true:

- The host platform, robot type, and drive support drive cleaning.
- The drive must support the TapeAlert capability, and the TapeAlert are enabled on the drive.  
To determine if a drive supports TapeAlert, see the Symantec support Web site.
- A cleaning tape is configured and available in NetBackup for the robotic library. The cleaning cartridge is compatible with the drive that needs to be cleaned.
- The cleaning tape has not reached its end of life.
- Pass through device files are configured on UNIX media servers.  
See the *NetBackup Device Configuration Guide*.

## TapeAlert logs and codes

TapeAlert codes are derived from the T10 SCSI-3 Stream Commands standard (see <http://t10.org/>). For the list of codes that the device supports, see the device's documentation.

TapeAlert checks for errors of the following types:

- Recoverable read and write drive problems
- Unrecoverable read and write drive problems
- Hardware defects
- Wrong or worn-out media
- Expired cleaning tapes
- Abnormal errors

A set of TapeAlert conditions is defined that can cause the media in use to be frozen. Another set of conditions are defined that can cause a drive to be downed.

NetBackup writes TapeAlert conditions into the following logs:

- The `bptm` log
- The error log
- The job details log
- The system log on UNIX and Event Viewer on Windows

The following table describes the codes.

**Table 5-11** TapeAlert log codes

TapeAlert code	Default action	Error type	Error message
0x01	None	Warning - WRN	Read warning
0x02	None	Warning - WRN	Write warning
0x03	None	Warning - WRN	Hard error
0x04	Freeze media - FRZ	Critical - CRT	Media
0x05	Freeze media - FRZ	Critical - CRT	Read failure
0x06	Freeze media - FRZ	Critical - CRT	Write failure
0x07	Freeze media - FRZ	Warning - WRN	Media life
0x08	Freeze media - FRZ	Warning - WRN	Not data grade
0x09	None	Critical - CRT	Write protect
0x0a	None	Informational - INFO	No removal
0x0b	None	Informational - INFO	Cleaning media
0x0c	None	Informational - INFO	Unsupported format
0x0d	Freeze media - FRZ	Critical - CRT	Recoverable mechanical cartridge failure
0x0e	Freeze media - FRZ	Critical - CRT	Unrecoverable mechanical cartridge failure
0x0f	Freeze media - FRZ	Warning - WRN	Mic failure
0x10	None	Critical - CRT	Forced eject
0x11	None	Warning - WRN	Read only

**Table 5-11** TapeAlert log codes (*continued*)

TapeAlert code	Default action	Error type	Error message
0x12	None	Warning - WRN	Directory corrupted on load
0x13	Freeze media - FRZ	Informational - INFO	Nearing media life
0x14	Clean drive - CLN	Critical - CRT	Clean now
0x15	Clean drive - CLN	Warning - WRN	Clean periodic
0x16	Freeze media - FRZ	Critical - CRT	Expired cleaning media
0x17	Freeze media - FRZ	Critical - CRT	Invalid cleaning tape
0x18	None	Warning - WRN	Retension requested
0x19	None	Warning - WRN	Dual-port error
0x1a	None	Warning - WRN	Cooling fan failure
0x1b	None	Warning - WRN	Power supply failure
0x1c	None	Warning - WRN	Power consumption
0x1d	None	Warning - WRN	Drive maintenance
0x1e	Down drive - down	Critical - CRT	Hardware A
0x1f	Down drive - DOWN	Critical - CRT	Hardware B
0x20	None	Warning - WRN	Interface
0x21	None	Critical - CRT	Eject media
0x22	None	Warning - WRN	Download fail
0x23	None	Warning - WRN	Drive humidity
0x24	None	Warning - WRN	Drive temperature
0x25	None	Warning - WRN	Drive voltage
0x26	None	Critical - CRT	Predictive failure
0x27	None	Warning - WRN	Diagnostics req.
0x28 - 0x31	None	Informational - INFO	Undefined
0x32	None	Warning - WRN	Lost statistics

**Table 5-11** TapeAlert log codes (*continued*)

TapeAlert code	Default action	Error type	Error message
0x33	Freeze media - FRZ	Warning - WRN	Directory invalid on unload
0x34	Freeze media - FRZ	Critical - CRT	System area write failure
0x35	Freeze media - FRZ	Critical - CRT	System area read failure
0x36	Freeze media - FRZ	Critical - CRT	No start of data
0x37	Freeze media - FRZ	Critical - CRT	Loading failure
0x38	Freeze media - FRZ	Critical - CRT	Unrecoverable unload failure
0x39	None	Critical - CRT	Automation interface failure
0x3a	None	Warning - WRN	Firmware failure
0x3d - 0x40	None	Informational - info	Undefined

## About tape drive cleaning

The following types of drive cleaning are available by using NetBackup:

- **Reactive cleaning**  
See [“About TapeAlert cleaning \(reactive cleaning\)”](#) on page 186.  
Symantec recommends that you use reactive cleaning.
  - **Library-based cleaning**  
See [“About library-based cleaning”](#) on page 191.
  - **Frequency-based cleaning**  
See [“About frequency-based cleaning”](#) on page 191.
  - **Operator-initiated cleaning**  
See [“About operator-initiated cleaning”](#) on page 192.
- See [“About using a cleaning tape”](#) on page 192.

## About library-based cleaning

NetBackup does not support library-based cleaning for most robots because robotic library and operating systems vendors implement this cleaning in different ways. (Library-based cleaning also is known as robotic cleaning or auto cleaning.) These different methods often interfere with NetBackup robotic control operations.

NetBackup does not define the cleaning media that is used for library-based cleaning, and the robotic library manages the cleaning media.

Because TapeAlert provides the same type of cleaning as library-based cleaning, Symantec recommends disabling library-based cleaning when you use TapeAlert.

## About frequency-based cleaning

Frequency-based cleaning occurs when the accumulated mount time exceeds the time you specify for the cleaning frequency. NetBackup updates the mount time for the drive each time a tape is unmounted.

The cleaning frequency is configured when a drive is added to NetBackup. Change the cleaning frequency by changing the drive properties or by using the **Media and Device Management Device Monitor** in the **NetBackup Administration Console**.

If the following conditions are met, drive cleaning occurs when the accumulated mount time exceeds the time specified for the cleaning frequency:

- The drive is in a robotic library that supports drive cleaning.
- A cleaning tape is configured and available for the robotic library.
- The cleaning tape has cleanings remaining.

NetBackup cleans the drive immediately after a tape is unmounted. Drive cleaning does not unmount a drive in the middle of an active backup. The mount time is reset after the drive is cleaned. The cleaning frequency value remains the same.

A cleaning can occur within a backup if the backup spans tapes. For example, if cleaning is due after the first tape is full, NetBackup cleans the drive before it mounts the next tape.

Media can remain in a drive for extended periods. It does not affect the cleaning frequency because NetBackup increments the mount time only when NetBackup assigns the media to a process.

Frequency-based cleaning is not supported for drives in the ACS or the TLH libraries that are under API robotic control. The robotic library software controls the drive cleaning. To manage drive cleaning for these robots, use the robot vendor interfaces.

See [“About TapeAlert and frequency-based cleaning”](#) on page 187.

## About operator-initiated cleaning

A drive cleaning can be initiated regardless of the cleaning frequency or accumulated mount time of the drive. Clean standalone drives or robotic drives if a cleaning tape of the correct media type and residence for the drive was added to NetBackup.

NetBackup reports that a drive needs cleaning if either of the following conditions are true:

- The value for the mount time is greater than the cleaning frequency.
- The TapeAlert CLEAN\_NOW or CLEAN\_PERIODIC flag is set.

And either of the following conditions must be true:

- The drive is a standalone drive and a cleaning tape is not defined.
- The drive is a standalone drive and no cleaning tape has any cleanings that remain.

NetBackup displays NEEDS CLEANING as follows:

- The **Tape Cleaning Comment** column of the **Drive List** in the **Devices** node of the **NetBackup Administration Console**.
- The comment field of the output from the `tpclean -L` command.

## About using a cleaning tape

You can specify the number of cleanings that are allowed for a cleaning tape. This number is reduced with each cleaning. When the number of cleanings is zero, NetBackup stops by using the cleaning tape. Then, use a new cleaning tape or increase the number of cleanings that are allowed for the tape.

---

**Note:** NetBackup does not control the cleaning tapes that library-based cleaning uses.

---

Symantec suggests following the recommendations from cleaning tape vendors for the amount of tape usage. If you clean a tape past its recommended life, cleaning delays can occur (due to excessive tape position operations) and drives can be downed.

## How NetBackup selects drives

NetBackup stores media information and device configuration and status information in the EMM database. When a robotic mount request is issued, the NetBackup Resource Broker (`nbrrb`) queries the EMM database for the media ID of the volume requested. If the volume is in the EMM database, the media request is matched with a compatible drive in the robot. The mount request is forwarded to the appropriate robotic daemon (UNIX) or process (Windows) based on the location of the media. Location is the robotic library and the storage slot number, if applicable.

A drive must meet the following criteria to be selected for the mount request:

- The drive is configured.
- The drive is in the robotic library that contains the media.
- The drive allows the requested media density.

The EMM server (`nbemm`) manages the drives and requests for locally-attached or shared drives in the EMM domain.

The EMM server manages the drives by doing the following actions:

- Determines which of the drives are currently available.
  - A drive is available if it is one of the following:
    - Configured as UP
    - Not assigned
    - Compatible with the media type
    - Not reserved by another host
- Picks an available drive that was least recently used.
  - NetBackup selects the robotic-based drives over standalone drives unless the correct media already is loaded in a standalone drive.

The first drive in the drive configuration is used first, and then the second drive, and then the next. Use the `tpconfig -d` command to see the drive order in the configuration.

If some of the drives are shared drives, NetBackup chooses a nonshared drive first (if one is available). NetBackup chooses a shared drive first so the shared drives can be used on other hosts that share the drives. Shared drives require the Shared Storage Option.

# How NetBackup reserves drives

In multiple-initiator (multiple host bus adapter) environments, device-level access protection is required to avoid unintended sharing of tape devices and possible data loss problems. (Shared Storage Option is a multiple-initiator environment.) Access protection on a tape drive prevents an HBA that is not the reservation owner from issuing commands to control the drive. SCSI access protection operates at the SCSI target level and depends on correct operation of the fiber-to-SCSI bridge or the native fiber device hardware.

The only commonly available technique for this purpose is SPC-2 SCSI reserve and release functionality. All tape drive vendors support the SPC-2 SCSI reserve method. NetBackup has used SPC-2 SCSI reserve since NetBackup 3.4.3; it is the default tape drive reservation method in NetBackup. SPC-2 SCSI reserve is effective for most NetBackup environments.

Alternatively, the new SCSI persistent reserve method may be more effective in either of the following environments because it provides device status detection and correction:

- NetBackup media servers are in a cluster environment  
NetBackup can recover and use a reserved drive after a failover (if NetBackup owns the reservation). (With SPC-2 SCSI reserve, a drive reset usually is required because the reservation owner is inoperative.)
- Environments where high drive availability is important  
NetBackup can resolve NetBackup drive reservation conflicts and maintain high drive availability. (SPC-2 SCSI reserve provides no method for drive status detection.)

However, the SCSI persistent reserve method is not supported or not supported correctly by all device vendors. Therefore, analyze the environment to ensure that all of the hardware supports SCSI persistent reserve correctly. NetBackup lets you configure either SCSI persistent reserve or SPC-2 SCSI reserve.

The following table describes the protection options.

Table 5-12 Protection options

Option	Description
SCSI persistent reserve	Provides SCSI persistent reserve protection for SCSI devices. The devices must conform to the SCSI Primary Commands - 3 (SPC-3) standard.
SPC-2 SCSI reserve (default)	Provides SPC-2 SCSI reserve protection for SCSI devices. The devices must conform to the reserve method and release management method in the SCSI Primary Commands - 2 standard.

Table 5-12 Protection options (*continued*)

Option	Description
No protection	Other HBAs can send the commands that may cause a loss of data to the tape drives.

You can configure access protection for each NetBackup media server. The protection setting configures tape drive access protection for all tape drive paths from the media server on which the setting is configured. The media server setting for any drive path can be overridden.

SCSI reservations provide protection for NetBackup Shared Storage Option environments or any other multiple-initiator environment in which drives are shared.

## About SCSI persistent reserve

The NetBackup process that reads from or writes to the media in a drive (`bptm`) issues SCSI persistent reserve commands to do the following:

- Register with the tape drive's device server (the server is a logical unit within a drive that processes SCSI tasks)
- Request an exclusive access reservation

If the tape drive's device server grants the reservation, the NetBackup process has exclusive use of the device. The reservation prevents other host bus adapters (HBAs) from issuing any commands that can cause data loss.

If the reservation fails, NetBackup fails the job.

When the NetBackup process is finished with the drive, NetBackup unloads the drive and sends a persistent reserve clear command to the drive. The command removes both the reservation and the registration.

SCSI persistent reserve also provides device status detection, which NetBackup uses to resolve reservation conflicts within NetBackup.

The reservation does not prevent other applications on the host that has the reservation from using the same device and from causing data loss. For example, if a user on the same host issues a `UNIX mt` command, the `mt` command can take control of the drive.

Also, other HBAs can clear or release a SCSI persistent reservation. Therefore, an application can clear another HBA reservation (although it should not do so).

## About SCSI persistent reserve commands

When a device receives an exclusive access type SCSI persistent reservation command, it does not process commands from any other HBA. The device processes commands from another HBA only when the HBA that owns the SCSI persistent reservation clears the reservation. If an application sends a command to a reserved device, the device fails the command by returning a status of RESERVATION CONFLICT. The only exceptions to this action are several commands that cannot interfere with the reservation, such as Inquiry or Request Sense.

A device stays reserved until one of the following events occurs on the device:

- Released by the HBA that reserved it
- Power cycled (usually)
- Preempted by a SCSI persistent reserve command

## About SCSI persistent reserve conflicts

NetBackup uses unique reservation keys. Therefore, NetBackup attempts to resolve conflicts with other NetBackup reservations. If a conflict exists, NetBackup sends SCSI commands to unload the drive. Based on the drive status, NetBackup tries to unload the drive again by using additional information to release or preempt the persistent reservation.

In cluster environments after a failover event, NetBackup on the active cluster node detects the persistent reservation and clears the reservation. NetBackup regains use of the drive without power-cycling the drive.

If NetBackup does not own the persistent reservation, NetBackup reports a pending status in the Device Monitor. The reservation owner must clear the reservation before NetBackup can use the drive. For example, NetBackup does not clear a NetApp persistent reservation.

## About the SPC-2 SCSI reserve process

The NetBackup process issues an SPC-2 SCSI reserve command to the tape drive that contains the media. (The process can be `bptm`, `bprecover`, or `bpbbackupdb`.) If the device is not reserved, NetBackup acquires a reservation. The drive does not process commands from any other host bus adapters (HBAs) until NetBackup releases the reservation or the reservation is broken. If the reservation fails, NetBackup fails the job.

The reservation does not prevent other applications on the host that has the reservation from using the same device and from causing data loss. For example, if a user on the same host issues a UNIX `mt` command, the `mt` command can take control of the drive.

After the NetBackup process finishes with the media, it issues an SPC-2 SCSI command to release the reservation during the unmount operation. The release frees the device for access by another HBA.

SCSI reserve does not provide a method to determine if a device is reserved. Only the reservation owner (the host bus adapter) can release the reservation. However, these limitations do not interfere with NetBackup operations in most environments.

## About SPC-2 SCSI reserve commands

When a device receives an exclusive access type SCSI persistent reservation command, it does not process commands from any other HBA. The device processes commands from another HBA only when the HBA that owns the reservation issues the release command. If an application sends a command to a reserved device, the device fails the command by returning a status of RESERVATION CONFLICT. The only exceptions to this action are several commands that cannot interfere with the reservation, such as Inquiry or Request Sense.

A device stays reserved until one of the following events occurs on the device:

- Released by the HBA that reserved it
- Released by a TARGET or a LOGICAL UNIT RESET  
These resets are protocol dependent and differ between parallel SCSI and FCP (SCSI on Fibre Channel). These resets can be issued from any HBA.
- Released by Fibre Channel LOGO, PLOGO, PRLI, PRLO, or TPRLO action or failed discovery (link actions)
- Power cycled

A negative consequence of SPC-2 SCSI reserve occurs if the HBA that owns the reservation fails. A device stays reserved until the reservation is removed or broken. Only the original HBA can remove the reservation, which means the system must be available. If the HBA that owns the reservation fails, it cannot remove the reservation. Therefore, the reservation must be broken.

To break a reservation, one of the following actions must break the reservation:

- SCSI reset
- Bus device reset
- LUN device reset
- Power cycle
- Fibre Channel link actions may break reservations

SPC-2 SCSI reserve commands are mandatory for all SCSI-2 and SCSI-3 devices. See the SCSI 2 standard for a detailed description of SCSI reserve command operation and behavior.

## About SCSI reservation conflicts

The NetBackup Automatic Volume Recognition process (`avrd`) manages access to tape devices. A properly configured NetBackup environment and properly configured tape devices should not receive a reservation conflict message from a tape drive. When `avrd` starts, it issues an SPC-2 SCSI release to all configured, nondisabled tape drive paths that are currently in the Up state. The command releases all devices that were SPC-2 reserved at the time of a system restart or crash. The SCSI release command returns tape devices to general availability after a system crash.

If the `avrd` process receives a reservation conflict message, it changes the status of the device to PEND. It also writes the following message in the system log:

```
Reservation Conflict status from DRIVENAME (device NUMBER)
```

Also, the **NetBackup Administration Console Device Monitor** or the output from the `vmopr cmd` command shows PEND in the Control column.

If a conflict occurs, a reservation problem can exist. If the HBA that reserves the drive is unavailable (for example, due to a system crash or hardware failure), it cannot release the reservation. NetBackup cannot release or break an SPC-2 SCSI reservation automatically. Force a release or break the reservation to make the drive available, even for a failover server in a cluster environment.

When the conflict is resolved, the following message is written to the log:

```
Reservation Conflict status cleared from DRIVENAME (device NUMBER)
```

## About forcing a release of an unavailable HBA's SPC-2 reservation

To force a release of an unavailable HBA's SPC-2 reservation, use the following NetBackup `vmopr cmd` command and option:

```
vmopr cmd -crawlreleasebyname drive_name
```

This option requests that all hosts that are registered to use the drive issue SPC-2 SCSI release commands to the drive.

Issue the `vmopr cmd` command on the host that is the device allocator (DA host). Alternatively, use the `-h` option of the command to specify the DA host. The DA host is also the EMM server.

---

**Note:** Use this command after a PEND status appears in the **NetBackup Administration Console Device Monitor**. However, do not issue this command during backups.

---

More information about using the `vmopr cmd` command is available.

See *NetBackup Commands Reference Guide*.

## Breaking a reservation

If you cannot release an SPC-2 SCSI reservation, try to use an operating system command that forces a device reset. A device reset breaks a reservation. The procedure depends on the operating system type.

---

**Note:** The reset operation can reset other devices in the configuration. Loss of data is also possible. Try alternate methods first to break the reservation on a device (by using switch and bridge hardware).

---

Lastly, if the following operating system commands cannot break the reservation, power-cycle the drive. A power cycle breaks SPC-2 SCSI drive reservations (and usually breaks SCSI persistent drive reservations).

### To break an SPC-2 reservation on Solaris

- 1 Issue `mt -f drive_path_name forcereserve`.
- 2 Issue `mt -f drive_path_name release`.

See the `mt(1)` man page for more information.

### To break an SPC-2 reservation on HP-UX

- ◆ Issue `st -f drive_path_name -r`.

See the `st(1m)` man page for more information.

### To break an SPC-2 reservation on AIX

- ◆ Issue `tctl -f drive_path_name reset`.

See the `tctl` man page (in the IBM AIX Commands Reference) for more information.

## About SCSI reserve requirements

To use SCSI persistent reserve or SPC-2 SCSI reserve, the following requirements must be met:

- There must be pass through driver access to all shared drives.

The pass through driver must be installed and all required paths must be created.

Information about how to configure and use the pass through driver for UNIX operating systems is available.

See the *NetBackup Device Configuration Guide*.

- You must configure the operating systems on the NetBackup media servers so they let NetBackup control SCSI persistent reserve or SPC-2 SCSI reserve.
- On HP-UX systems, disable the operating system's use of SPC-2 SCSI reserve. See the *NetBackup Device Configuration Guide*.
- Depending on the tape drives, you may have to disable the operating system's use of SPC-2 SCSI reserve. AIX and Solaris may require such a change. See the *NetBackup Device Configuration Guide*.

## About SCSI reserve limitations

The NetBackup implementation of SCSI persistent reserve and SPC-2 reserve has the following limitations:

- SCSI persistent reserve and SPC-2 reserve do not apply to NDMP drives. The NDMP filer is responsible for providing exclusive device access.
- Third-party copy configurations must be configured correctly. To retain reservation of a tape device during a third-party copy backup, configure the NetBackup `mover.conf` file. Do not use SCSI persistent reserve on the drive paths that are used for third-party copy backups. See the *NetBackup Snapshot Client Administrator's Guide*.
- With SPC-2 SCSI reserve, devices may remain reserved after a failover in cluster environments or multipath environments with failover capability. You cannot use SPC-2 SCSI reserve if the following factors are true: The failover does not break the device reservations and those devices that were in use during the failover must be available without manual intervention. Use SCSI persistent reserve.
- If the drive path changes, the backup jobs and the restore jobs fail. Therefore, jobs fail in cluster environments or any multipath environments that share paths dynamically. If you cannot disable dynamic path sharing, you cannot use SPC-2 SCSI reserve or SCSI persistent reserve in NetBackup.

## About SCSI reservation logging

The `bptm` process logs SCSI reservation-related commands. Examine the `bptm` log on all NetBackup media servers to ensure that the SCSI operations are logged. SCSI reservation commands are labeled SCSI PERSISTENT RESERVE or SCSI RESERVE in the log.

In addition, information about the SCSI persistent reservations that are broken are also written to the NetBackup Problems report.

## About server operating system limitations on Windows

Windows operating systems cannot distinguish between a reserved device and a busy device. Therefore, PEND appears in the Device Monitor if another application controls the tape drive. NetBackup cannot share tape devices with other applications. If you use other applications, use the NetBackup `tpreq` command or Down the drive before using the drive.

These operating systems also may report PEND if the drive reports Busy when a volume is unmounted. Use the `AVRD_PEND_DELAY` entry in the `vm.conf` configuration file to filter out these extraneous reports.

## About checking for data loss

To detect data loss, the `bptm` process reads the tape position and then verifies the actual position against the expected position.

If the actual position is less than the expected position at the end of the backup process, the following events occur:

- The tape is frozen.
- The backup fails.
- The following error message entry is written to the `bptm` log:

```
FREEZING media id xxxxxx, External event caused rewind during  
write, all data on media is lost
```

## About possible data loss causes

If tape drive access protection is not enabled on the NetBackup media servers, the following may cause data loss: configuration errors, incorrect paths, multiple master servers, incorrect Shared Storage Option configurations, and third-party or operating system utilities.

If access protection is enabled on all NetBackup media servers, the following can cause data loss: any third-party or operating system utilities that run on the server that runs the NetBackup backup job.

Unfortunately, data loss cannot be prevented only recognized after the fact. NetBackup does not remove catalog information about the backup sessions that were lost. Use the `bpexpdate` command to expire the images for the lost backup sessions.

## About checking for tape and driver configuration errors

To detect data loss, the `bptm` process reads the tape position and then verifies the actual position against the expected position.

If a configuration problem causes the actual position to be greater than the expected position at the end of the backup process, the following events occur:

- The tape is frozen.
- The backup fails.
- The following error message entry is placed in the `bptm` log:

```
FREEZING media id xxxxxx, too many data blocks written, check  
tape/driver block size configuration
```

The backup data may be usable. If so, import the image by using the NetBackup `bpimport` command so the data is available for restores.

## About common configuration problems

Identify and fix the source of the configuration problem that causes data loss. The most common configuration error is a failure to configure the driver for variable length blocks.

A less common error may be in the tape driver's configuration data, such as in the `/kernel/drv/st.conf` file on a Solaris system.

Information about tape driver configuration is available.

See the *NetBackup Device Configuration Guide*.

## About configuring SCSI reserve

The SCSI reserve protection setting configures tape drive access protection for all tape drives from the media server on which the setting is configured. You can configure the protection for each media server and override the global setting for any drive path.

To configure SCSI reserve protection on a media server: use the **NetBackup Administration Console** to set the media server host property **Enable SCSI Reserve** on the **Media** tab.

To override the media server protection setting: use the **NetBackup Administration Console** to set the drive path property **Override SCSI reserve settings** when you add a drive or change a drive's properties.

## How NetBackup selects media

How NetBackup selects media depends on whether the media is in a robot or a standalone drive.

See [“About selecting media in robots”](#) on page 203.

See [“About selecting media in standalone drives”](#) on page 206.

### About selecting media in robots

When NetBackup receives a request for a volume, it searches the EMM database for the media ID. The external media ID should correspond to the NetBackup media ID.

A request for a volume includes the following attributes:

- The media ID
- The device density
- The file name that is used to link to the device that is assigned.

NetBackup selects a volume in a robot in the following order:

- NetBackup searches the media catalog for a volume that is already mounted in a drive and meets the following criteria:
- Configured to contain backups at the retention level that the backup schedule requires. However, if the NetBackup **Media** host property **Allow multiple retentions per media** is specified for the server, NetBackup does not search by retention level.
  - In the volume pool that the backup job requires.
  - Not in a FULL, FROZEN, IMPORTED, or SUSPENDED state.
  - Of the same density that the backup job requested, and in the robot that that the backup job requested.
  - Not currently in use by another backup or a restore.
  - Not written in a protected format. NetBackup detects tape format after the volume is mounted. If the volume is in a protected format, NetBackup unmounts the volume and resumes the search.

If a suitable volume is found, NetBackup uses it.

If NetBackup cannot find a mounted volume that satisfies all of the previous conditions, it checks the media catalog for any volume that is suitable.

- If a suitable volume is in a robot, NetBackup issues the commands that move the volume to a drive, position the heads to the beginning of the volume, and assign it to the request. No manual intervention is required.
- If a suitable volume is not in a robot but is in a standalone drive, NetBackup automatically mounts and assigns it. No manual intervention is required.
- If a suitable volume is not in a robot or a standalone drive and the request is media-specific, NetBackup may pend a mount request. A media-specific mount request is one for a restore, for an import, or from the `tpreq` command.
- If a suitable volume is not in a robot or a standalone drive, NetBackup may attempt to use another volume only as follows: For backup jobs for which any other media can be used.

If a suitable volume does not exist or if a suitable volume is at end of media (EOM), NetBackup assigns a new volume. NetBackup may assign a new volume even if a volume is not full (because NetBackup received an EOM message from the drive).

The new volume must meet all of the following criteria:

- Is the correct media type
- Is for the correct robot type (if applicable)
- Is located in the requested robotic peripheral (if applicable)
- Resides on the requested host
- Is in the correct volume pool
- Is not currently assigned (not already allocated to NetBackup)
- Is not expired (if an expiration date is defined in NetBackup)
- Has not exceeded the maximum number of mounts allowed

If more than one volume qualifies, NetBackup chooses the volume that was least recently used.

NetBackup then adds it to the media catalog and assigns it the specified retention level.

If there are no unassigned volumes of the requested type, the backup terminates with an error message that no media were available.

NetBackup selects a volume in a robot in the following order:

- NetBackup searches the media catalog for a volume that is already mounted in a drive and meets the following criteria:
  - Configured to contain backups at the retention level that the backup schedule requires. However, if the NetBackup **Media** host property **Allow multiple retentions per media** is specified for the server, NetBackup does not search by retention level.
  - In the volume pool that the backup job requires.
  - Not in a FULL, FROZEN, IMPORTED, or SUSPENDED state.

- Of the same density that the backup job requested, and in the robot that that the backup job requested.
- Not currently in use by another backup or a restore.
- Not written in a protected format. NetBackup detects tape format after the volume is mounted. If the volume is in a protected format, NetBackup unmounts the volume and resumes the search.

If a suitable volume is found, NetBackup uses it.

- If NetBackup cannot find a mounted volume that satisfies all of the previous conditions, it checks the media catalog for any volume that is suitable.
  - If a suitable volume is in a robot, NetBackup issues the commands that do the following: Move the volume to a drive, position the heads to the beginning of the volume, and assign it to the request. No manual intervention is required.
  - If a suitable volume is not in a robot but is in a standalone drive, NetBackup automatically mounts and assigns it. No manual intervention is required.
  - If a suitable volume is not in a robot or a standalone drive and the request is media-specific, NetBackup may pend a mount request. A media-specific mount request is one for a restore, for an import, or from the `tpreq` command.
  - If a suitable volume is not in a robot or a standalone drive, NetBackup may attempt to use another volume only as follows: For backup jobs for which any other media can be used.
- If a suitable volume does not exist or if a suitable volume is at end of media (EOM), NetBackup assigns a new volume. NetBackup may assign a new volume even if a volume is not full (because NetBackup received an EOM message from the drive).

The new volume must meet all of the following criteria:

- Is the correct media type
- Is for the correct robot type (if applicable)
- Is located in the requested robotic peripheral (if applicable)
- Resides on the requested host
- Is in the correct volume pool
- Is not currently assigned (not already allocated to NetBackup)
- Is not expired (if an expiration date is defined in NetBackup)
- Has not exceeded the maximum number of mounts allowed

- If more than one volume qualifies, NetBackup chooses the volume that was least recently used.  
NetBackup then adds it to the media catalog and assigns it the specified retention level.
- If there are no unassigned volumes of the requested type, the backup terminates with an error message that no media were available.

See [“About spanning media with automatic media selection”](#) on page 206.

## About spanning media with automatic media selection

After an end of media (EOM) is reached, automatic media selection depends on whether NetBackup is configured to allow backups to span media, as follows:

- NetBackup spans media if the NetBackup **Media** host property **Allow backups to span media** is specified for the server.  
In this case, NetBackup uses another volume to start the next fragment and the resulting backup is composed of fragments on different volumes.
- NetBackup does not span media if the media **Allow backups to span media** property is not specified.  
In this case, the backup terminates abnormally and the operation is retried according to the NetBackup Global Attributes host property, **Schedule backup attempts**.

## About selecting media in standalone drives

The following topics explain media selection and other aspects of standalone drive operations:

See [“About selecting media by using standalone drive extensions”](#) on page 206.

See [“About disabling standalone drive extensions”](#) on page 207.

See [“About spanning media”](#) on page 207.

See [“About leaving standalone drives in the ready state”](#) on page 208.

## About selecting media by using standalone drive extensions

With NetBackup standalone drive extensions, NetBackup tries to use any labeled or any unlabeled media that is in a standalone drive. This capability is enabled by default during installation.

The media selection process is as follows:

- If a backup is requested and an appropriate standalone drive contains a volume, NetBackup tries to select and use that volume.

- If an appropriate drive does not contain a volume, NetBackup selects a volume. See [“About selecting media in robots”](#) on page 203.

The Device Monitor shows the mount request, and an operator must manually insert the volume and assign it to a drive.

A volume that was used previously for backups must meet the following criteria:

- Not be FULL, FROZEN, or SUSPENDED
- Contain backups at the retention level and be in the same volume pool as the backup that requires a volume.  
However, if the NetBackup **Media** host property **Allow multiple retentions per media** is specified for the server, NetBackup does not require a specific retention level.

NetBackup selects unlabeled media only if the existing volumes that meet the appropriate criteria do not have available space to contain the new backup images.

If the media is unlabeled, the following actions occur:

- NetBackup labels the media.
- NetBackup adds a media ID to the volume configuration, if necessary.  
If a media ID is added, the NetBackup Media ID prefix (non-robotic) is used as the first characters of the media ID.
- If a media ID prefix is not specified, the default prefix is the letter A. For example, A00000.
- NetBackup adds the requested volume pool to the volume configuration (if the backup policy specifies a volume pool).

If the unused media is unlabeled, label it by using the `bplabel` command. Specify the `-u` parameter to force assignment of a specific drive index, which eliminates the need to assign the drive manually.

## About disabling standalone drive extensions

Disable the standalone drive extensions by clearing the NetBackup media server host property, **Enable standalone drive extensions**. If this property is cleared, NetBackup uses the same method to select media for standalone drives as it uses for robotic drives.

## About spanning media

Media selection after an end of media (EOM) condition depends on whether NetBackup is configured to allow backups to span media, as follows:

- NetBackup spans media if the **Allow backups to span media** host property is specified for the server. NetBackup selects another volume to begin the next

fragment, and the resulting backup has data fragments on more than one volume.

After an EOM condition, NetBackup attempts to use an unassigned volume rather than one that already has images on it. NetBackup checks the EMM database for a volume that is the correct media type, in the correct volume pool, and so on.

If a suitable unassigned volume is unavailable, NetBackup selects a volume.

- NetBackup does not span media if the **Allow backups to span media** host property is not specified. The backup terminates abnormally when the end of media is reached. The operation is rescheduled according to the master server host property **Schedule backup attempts**.

You can further configure NetBackup behavior for standalone drives. Normally, when NetBackup spans media and an EOM is encountered on a standalone drive, NetBackup searches for other media or generates a pending mount request. You can configure a wait period for standalone drives. The wait period is helpful when a gravity feed tape stacker takes a long time to load the next media in the drive.

To configure NetBackup to wait, specify the **Media request delay** media server host property. This property specifies the number of seconds NetBackup waits to use a volume that is loaded in a compatible drive. After the wait period expires, NetBackup searches for another drive. NetBackup also waits to generate a pending mount request during tape span operations. The **Media request delay** property applies only when standalone drive extensions are enabled.

## About leaving standalone drives in the ready state

To leave standalone drives in a ready condition after a backup or restore completes, use the `nbemmcmd` command to enable the `-do_not_eject_standalone` option.

NetBackup does not eject the tape after an operation completes. The media is still ejected if EOM is reached or an error is encountered. Also, the media is ejected if the drive needs to be used with another media or the media needs to be used with another drive.

One standalone drive may be ready and contain suitable media.

Detailed information on the `nbemmcmd` command is available.

See *NetBackup Commands Reference Guide*.

## Volume pool and volume group examples

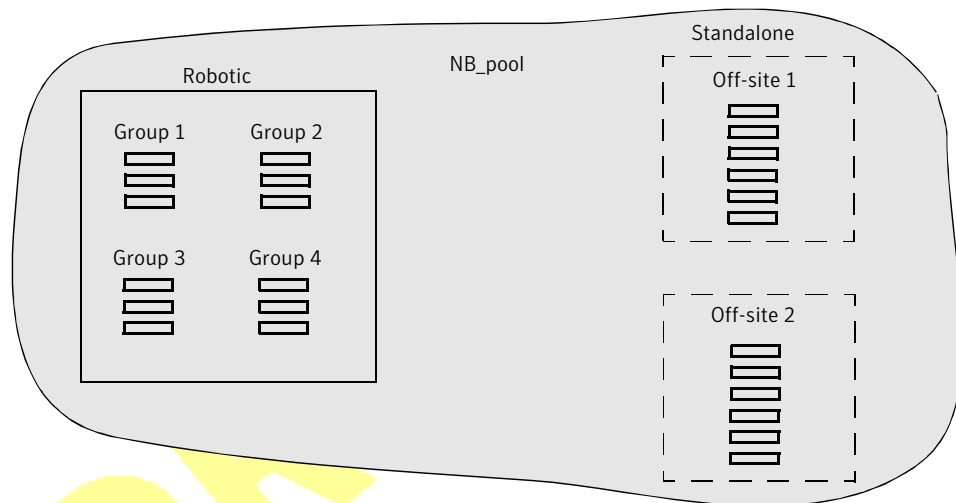

The following three examples show the relationship between volume pools and volume groups.

See [Figure 5-2](#) on page 209. for an example of one volume pool (named NB\_pool) and several volume groups.

You can move volumes between the groups in the robotic library and any groups that are off site. All volumes, however, remain in the same pool.

Media in the same volume pools are in different volume groups. Note that the data is stored on separate volumes by assigning different volume pools. The volumes in a pool can be in more than one physical location and in more than one volume group.

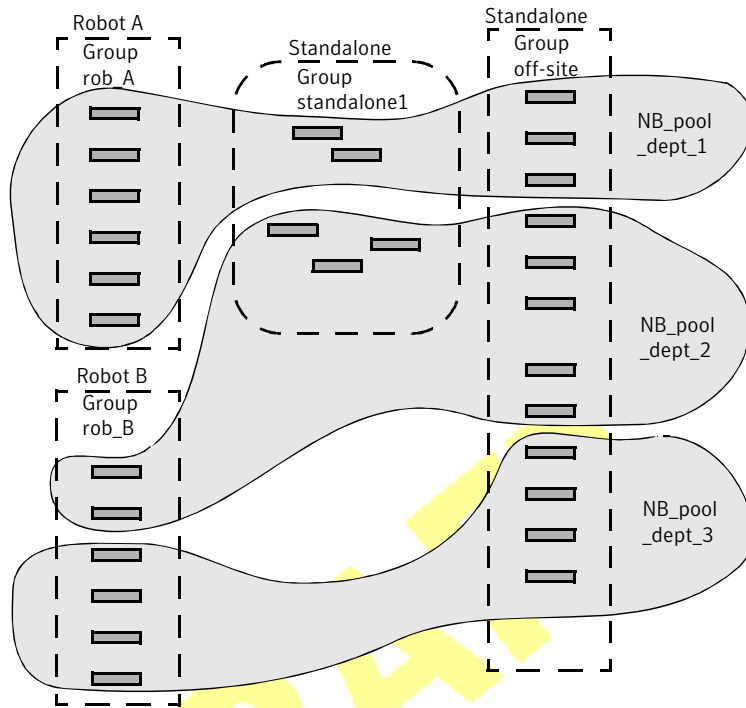

**Figure 5-2** Volume pool with multiple volume groups

See [Figure 5-3](#) on page 210. for examples of how the volumes in the pool NB\_pool\_dept\_1 are spread among the rob\_A, standalone1, and off-site volume groups.

These groups also have volumes from more than one pool (though the volumes in each group must all be the same type). You also can configure a scratch pool from which NetBackup can transfer volumes when a volume pool has no media available.

**Figure 5-3** Volume groups with multiple volume pools

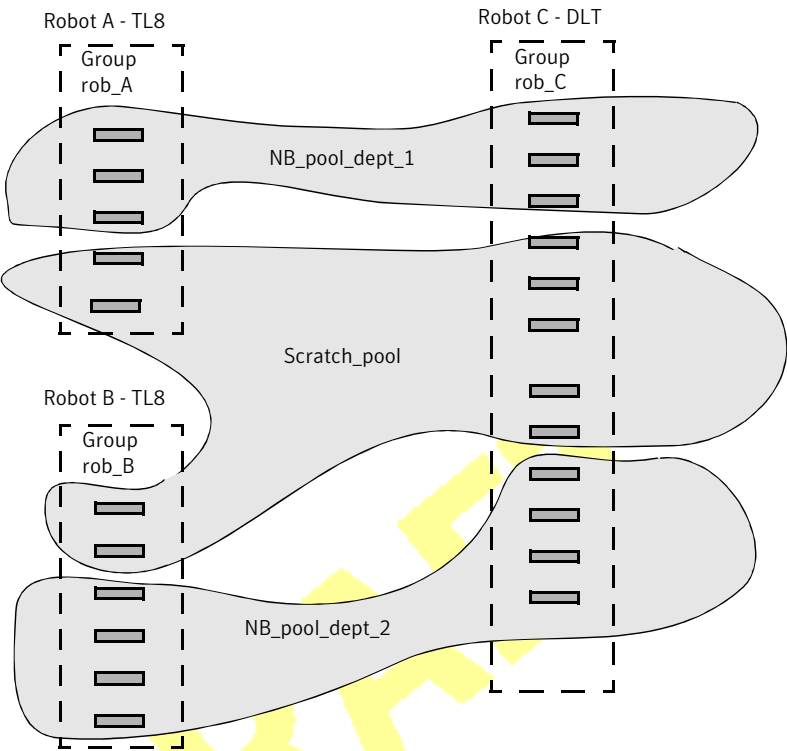

See [Figure 5-4](#) on page 211. for an example where the scratch pool is named `Scratch_pool`. The three robots contain volumes from that pool in addition to those from other pools.

Assume the following sequence of events:

- A backup job requires a DLT volume, so NetBackup attempts to assign one from `NB_pool_dept_1` in Robot C.
- Robot C has no unassigned volumes available in the `NB_pool_dept_1` pool.
- NetBackup searches the scratch pool for an unassigned DLT volume in Robot C. If a volume is available, NetBackup moves it to `NB_pool_dept_1`. Otherwise, NetBackup logs a `media unavailable` status.

Figure 5-4      Scratch pool example

# Media formats

NetBackup writes media in a format that allows the position to be verified before NetBackup appends new backups.

The following table shows the symbols that are used in the media format descriptions.

Table 5-13      Media format symbols

Symbol	Description
MH	Media header (1024 bytes).
*	Tape mark.
BH	Backup header (1024 bytes).

**Table 5-13** Media format symbols (*continued*)

Symbol	Description
BH1 ... BH <i>n</i>	Backup headers (1024 bytes). One for each job that is part of the set of the jobs that are multiplexed
Image	Data from the backup.
EH	Empty backup header, which is used for position validation.

The following table provides more information about how the media formats are used in different situations.

**Table 5-14** Media format descriptions

Format	Description
Standard tape format	<p>For all tape media except quarter-inch cartridge (QIC) and WORM, the format for the backups that are not multiplexed is as follows:</p> <p>MH * BH Image * BH Image * BH Image * EH *</p> <p>When a new backup image is added, the tape is positioned to the EH and the position is verified. The EH is overwritten by a BH and the backup proceeds. When complete, a new EH is written for future positioning validation.</p> <p>When NetBackup encounters the end of media during a write operation, it terminates the tape with two tape marks and does not write an EH.</p>
QIC and WORM tape format	<p>This format is used for quarter-inch cartridge (QIC) and WORM media. Unlike the standard tape format, NetBackup does not write empty backup headers (EH). The format is as follows:</p> <p>MH * BH Image * BH Image * BH Image *</p> <p>To append backup images to QIC media, NetBackup positions to the end of data (EOD) and then starts the next backup.</p>

**Table 5-14** Media format descriptions (*continued*)

Format	Description
Fragmented backup format	<p>For fragmented backups, the media format is similar to the standard tape format. The difference is that NetBackup breaks the backup image into fragments of the size that are specified when the storage unit is configured.</p> <p>The following is an example:</p> <pre>MH * BH Image (frag 1)* BH Image (frag 2)* BH Image (frag n) * EH *</pre> <p>Fragmentation is intended primarily for storing large backup images on a disk type storage unit.</p> <p>For multiplexed backups, image fragmentation results in faster restores because NetBackup can advance to the specific fragment before it begins a search for the file.</p> <p><b>Note:</b> If an error occurs in a backup, the entire backup is discarded and the backup restarts from the beginning. It does not restart from the fragment where the error occurred. Exception: checkpoint and restart backups resume from the last checkpoint fragment.</p>
Multiplexing format	<p>The tape format for multiplexed backups is as follows:</p> <pre>MH * BH1 ... BHn Image ...</pre> <p>By default, the data image is in 64-kilobyte blocks. Each block also contains 512 bytes that are reserved for multiplexing control information and to identify the backup to which the block corresponds.</p> <p>When a job ends or a new job is added to the multiplexing set, NetBackup writes a tape mark. NetBackup then starts multiplexing the revised set of jobs.</p> <p>The following is an example:</p> <pre>MH * BH1 BH2 BH3 Image* BH2 BH3 Image* BH2 BH3 BH4 Image. .</pre>

**Table 5-14** Media format descriptions (*continued*)

Format	Description
Spanning tape format	<p>By default, NetBackup spans a backup image to another tape if it encounters the end of media during a backup. The format is the same as described for fragmented backups. The first fragment on the next tape begins with the buffer of data where the end of media occurred.</p> <p>The following is the first tape format (NetBackup does not write an EH and terminates the tape with two tape marks):</p> <p>MH * ... *BHn Image (frag 1) * *</p> <p>The following is the second tape format:</p> <p>MH * BHn Image (frag2)* ... * EH *</p>

## Media Manager commands

On Windows:

Detailed information about the Media Manager commands is available. These commands are located in `install_path\VERITAS\Volmgr\bin`.

See the *NetBackup Commands Reference Guide* for detailed information about most of the commands that are in the following tables.

**Note:** Start and stop services by using the **Services** tool available in **Administrative Tools** in the Microsoft Windows Control Panel. If they are started from the command line, some services occupy that NetBackup Console session until they are stopped.

The following table shows the Media Manager services and processes and the commands that start each one.

**Table 5-15** Starting services and processes

Command	Description
acsd	<p>The Automated Cartridge System robotic process. The Device Manager <code>ltid</code> starts this process.</p> <p>Applies only to NetBackup Enterprise Server.</p>
avrd	The Automatic Volume Recognition process. The Device Manager <code>ltid</code> starts this process.

**Table 5-15** Starting services and processes (*continued*)

Command	Description
ltid	Starts the NetBackup Device Manager service. Starting <code>ltid</code> also starts the robotic, robotic control, Media Manager volume, and automatic volume recognition daemons.
tl4d	The tape library 4MM robotic process. The Device Manager <code>ltid</code> starts this process.
tl8cd	Starts the tape library 8MM robotic-control process. The Device Manager <code>ltid</code> starts this process.
tl8d	The tape library 8MM robotic process. The Device Manager <code>ltid</code> starts this process.
tlddcd	Starts the tape library DLT robotic-control process. The Device Manager <code>ltid</code> starts this process.
tldd	The tape library DLT robotic process. The Device Manager <code>ltid</code> starts this process.
tlhcd	Starts the tape library Half-inch robotic-control process. The Device Manager <code>ltid</code> starts this process. Applies only to NetBackup Enterprise Server.
tlhd	The tape library Half-inch robotic process. The Device Manager <code>ltid</code> starts this process. Applies only to NetBackup Enterprise Server.
tlmd	The tape library Multimedia process. The Device Manager <code>ltid</code> starts this process. Applies only to NetBackup Enterprise Server.
vmd	The NetBackup Volume Manager service. The Device Manager <code>ltid</code> starts this process.
vmacd	The NetBackup Status Collection service. The <code>nbermm</code> command starts this service on the same host as the EMM server if one or more NetBackup 5.x servers are present in the configuration.

The following table lists commands and the devices and processes that each one stops.

**Table 5-16** Stopping services and processes

Command	Description
<code>stopltid</code>	Stops the device, robotic, and robotic-control services.
<code>tlcdcd -t</code>	Stops the tape library DLT robotic-control process.
<code>tl8cd -t</code>	Stops the tape library 8MM robotic-control process.
<code>tlhcd -t</code>	Stops the tape library Half-inch robotic-control process. Applies only to NetBackup Enterprise Server.

On UNIX:

See the *NetBackup Commands Reference Guide* for detailed information about most of the commands that are in the following tables.

These commands are located in the `/usr/openv/volmgr/bin` directory.

The following table shows Media Manager daemons and the commands that start each one.

**Table 5-17** Starting daemons

Command	Description
<code>acsd</code>	The Automated Cartridge System robotic daemon. The Media Manager device daemon <code>ltid</code> starts this daemon. Applies only to NetBackup Enterprise Server.
<code>avrd</code>	The Automatic Volume Recognition daemon. The Media Manager device daemon <code>ltid</code> starts this daemon.
<code>ltid</code>	Starts the Media Manager device daemon. Starting <code>ltid</code> also starts the robotic, robotic control, and Media Manager volume and <code>avrd</code> daemons.
<code>tl4d</code>	The tape library 4MM robotic daemon. The Media Manager device daemon <code>ltid</code> starts this daemon.
<code>tl8cd</code>	Starts the tape library 8MM robotic-control daemon. The Media Manager device daemon <code>ltid</code> starts this daemon.
<code>tl8d</code>	The tape library 8MM robotic daemon. The Media Manager device daemon <code>ltid</code> starts this daemon.
<code>tlcdcd</code>	Starts the tape library DLT robotic-control daemon. The Media Manager device daemon <code>ltid</code> starts this daemon.

**Table 5-17** Starting daemons (*continued*)

Command	Description
<code>tldd</code>	The tape library DLT robotic daemon. The Media Manager device <code>daemonltid</code> starts this daemon.
<code>tlhcd</code>	Starts the tape library Half-inch robotic-control daemon. The Media Manager device <code>daemonltid</code> starts this daemon. Applies only to NetBackup Enterprise Server.
<code>tlhd</code>	The tape library Half-inch robotic daemon. The Media Manager device <code>daemonltid</code> starts this daemon. Applies only to NetBackup Enterprise Server.
<code>tlmd</code>	The tape library Multimedia daemon. The Media Manager device <code>daemonltid</code> starts this daemon. Applies only to NetBackup Enterprise Server.
<code>vmd</code>	The Media Manager volume daemon. The Media Manager device <code>daemonltid</code> starts this daemon.
<code>vmgcd</code>	The NetBackup Status Collection daemon. The <code>nbemm</code> command starts this daemon on the same host as the EMM server if one or more NetBackup 5.x servers are present in the configuration.

The following table shows Media Manager daemons and the commands that stop each one.

**Table 5-18** Stopping daemons

Command	Description
<code>kill pid</code>	Stops the process for the daemon with the specified <i>pid</i> (process ID). This command is a system command with a path of <code>/usr/bin/kill</code> or <code>/bin/kill</code> .
<code>stopltid</code>	Stops the device, robotic, and robotic-control daemons.
<code>tlgcd -t</code>	Stops the tape library DLT robotic-control daemon.
<code>tlgcd -t</code>	Stops the tape library 8MM robotic-control daemon.
<code>tlhcd -t</code>	Stops the tape library Half-inch robotic-control daemon. Applies only to NetBackup Enterprise Server.

## About Tape I/O commands on UNIX

To troubleshoot or test Media Manager, use the commands that are described in the following sections to manipulate volumes. Similarly, if you do not use NetBackup, you can use these commands to mount and manipulate volumes.

### About requesting tapes

The `tpreq` command lets you request a tape of a particular density and specify various options, such as the access mode. This command reserves a single drive and creates a file in the current working directory (unless a full path is specified). The file acts as a symbolic link to the tape and all subsequent access to the tape is through this file name. Users do not have to be concerned with the full path to a specific device file.

For all types of tapes, the tape is mounted and assigned when you enter the `tpreq` command.

By default, NetBackup assigns drives that support DLT cartridge tapes. You can use the density option on `tpreq` to request a drive that supports another density. For a list of supported densities and drive types, see the `tpreq` man page.

The density for the physical write is not selected automatically on drives. It is requested, so an operator can satisfy the correct drive. One of two methods is used to determine the drive density: the `/dev` device name that was used when the drive was configured or by how the drive is configured physically.

A `tpreq` command must include a media ID and a file name. If the tape volume is associated with a volume pool, the name of the volume pool can also be specified by using the `-p` parameter. If you specify the pool name, the name is validated against the pool name that is associated with the media in the EMM database.

See *NetBackup Commands Reference Guide*.

### About reading and writing tape files

Reading or writing tape files involves copying the file from tape to disk or from disk to tape. To perform read or write operations, use one of the UNIX commands that performs input and output operations, for example `tar` or `mt`.

### Positioning tape files

The `mt` command positions tape files by skipping forward or backward according to tape marks.

The following options are available on the `mt` command for positioning tapes:

- `eof, weof`  
Writes an end-of-file tape mark at the current position on the tape according to the `count` option on `mt`.
- `fsf, bsf`  
Spaces forward or backward the number of tape marks on the `count` option.
- `fsr, bsr`  
Spaces forward and backward the number of records according to the `count` option on `mt`. `bsr` is only supported for the undefined record type.

The following example uses the `mt` command to skip forward three files on a tape:

```
mt -f tape1 fsf 3
```

### Rewinding tape files

When a file is rewound, it is positioned to the beginning of the data. To rewind a tape file, you can use the `mt` command.

`tape1` is positioned to the beginning of the tape volume that is associated with the file.

The following command rewinds file `tape1`:

```
mt -f tape1 rewind
```

The `count` option is not used for the rewind operation. If you specify a count, `mt` ignores it.

## About removing tape files

When you have completed reading or writing tape files, use the `/usr/opensv/volmgr/bin/tpunmount` command to end the assignment of the tape file. This command removes from the directory the tape file you created by using `tpreq` and removes the tape volume from the tape drive. The `tpunmount` command is required for each file that the `tpreq` command creates.

See *NetBackup Commands Reference Guide*.

On UNIX, the NetBackup `tpunmount` command runs the `drive_unmount_notify` script (if it exists) after media is unmounted.

See [“drive\\_unmount\\_notify \(on UNIX\)”](#) on page 177.

## About external access to NetBackup controlled devices on UNIX

The Media Manager device daemon `ltid` restricts access to drives that are in an `UP` state by changing the permissions of the device files for those drives. The permissions are changed to `0600` when `ltid` starts and back to their original settings when `ltid` is terminated. The permissions also are returned to their original settings when a drive's state is changed to `DOWN`).

Do not modify the permissions of these device files when `ltid` is active. The NetBackup `avrd` daemon periodically tries to rewind and read data from media in the drives that are `UP` and are not currently assigned in NetBackup.

To ensure reliable operation, do not use UNIX tape and drive commands on the drives that are `UP` and controlled by `ltid`. Users can use the NetBackup `tpreq` and `tpunmount` commands and the `drive_mount_notify` and `drive_unmount_notify` scripts on those drives.

Information about the notify scripts is available.

See “NetBackup notify scripts” in the *NetBackup Administrator's Guide, Volume II*.

## About NetBackup user error messages

Explanations of Shared Server Option status messages and error messages are available.

See the *NetBackup Troubleshooting Guide*.

See the NetBackup Administration Console online Help.
