Technical Support

*Updated 03-11-11. Modified section "Customer service".
- Fran Heddings*

Symantec Technical Support maintains support centers globally. Technical Support's primary role is to respond to specific queries about product features and functionality. The Technical Support group also creates content for our online Knowledge Base. The Technical Support group works collaboratively with the other functional areas within Symantec to answer your questions in a timely fashion. For example, the Technical Support group works with Product Engineering and Symantec Security Response to provide alerting services and virus definition updates.

Symantec's support offerings include the following:

- A range of support options that give you the flexibility to select the right amount of service for any size organization
- Telephone and/or Web-based support that provides rapid response and up-to-the-minute information
- Upgrade assurance that delivers software upgrades
- Global support purchased on a regional business hours or 24 hours a day, 7 days a week basis
- Premium service offerings that include Account Management Services

For information about Symantec's support offerings, you can visit our website at the following URL:

www.symantec.com/business/support/

All support services will be delivered in accordance with your support agreement and the then-current enterprise technical support policy.

Contacting Technical Support

Customers with a current support agreement may access Technical Support information at the following URL:

www.symantec.com/business/support/

Before contacting Technical Support, make sure you have satisfied the system requirements that are listed in your product documentation. Also, you should be at the computer on which the problem occurred, in case it is necessary to replicate the problem.

When you contact Technical Support, please have the following information available:

- Product release level
- Hardware information
- Available memory, disk space, and NIC information
- Operating system
- Version and patch level
- Network topology
- Router, gateway, and IP address information
- Problem description:
 - Error messages and log files
 - Troubleshooting that was performed before contacting Symantec
 - Recent software configuration changes and network changes

Licensing and registration

If your Symantec product requires registration or a license key, access our technical support Web page at the following URL:

www.symantec.com/business/support/

Customer service

Customer service information is available at the following URL:

www.symantec.com/business/support/

Customer Service is available to assist with non-technical questions, such as the following types of issues:

- Questions regarding product licensing or serialization
- Product registration updates, such as address or name changes
- General product information (features, language availability, local dealers)
- Latest information about product updates and upgrades
- Information about upgrade assurance and support contracts
- Information about the Symantec Buying Programs
- Advice about Symantec's technical support options
- Nontechnical presales questions

- Issues that are related to CD-ROMs, DVDs, or manuals

Support agreement resources

If you want to contact Symantec regarding an existing support agreement, please contact the support agreement administration team for your region as follows:

Asia-Pacific and Japan	customercare_apac@symantec.com
Europe, Middle-East, and Africa	semea@symantec.com
North America and Latin America	supportsolutions@symantec.com

About configuring the account for NetBackup Exchange operations	46
About NetBackup and Microsoft Exchange Web Services (Exchange 2010)	49
Creating a privileged NetBackup user account for EWS access (Exchange 2010)	50
Creating a minimal NetBackup account for Exchange operations (Exchange 2010)	51
Configuring the account for NetBackup Exchange operations (Exchange 2007)	52
Configuring the account for NetBackup Exchange operations (Exchange 2003)	54
Configuring local security privileges for the account for NetBackup Exchange operations	55
Configuring an Exchange backup that uses Granular Recovery Technology (GRT) (non-VMware backups)	56
About installing and configuring Network File System (NFS) for Exchange Granular Recovery	59
About configuring Services for Network File System (NFS) on Windows 2012	60

About configuring Services for Network File System (NFS) on Windows 2008 and Windows 2008 R2	65
Disabling the Server for NFS	69
Disabling the Client for NFS on the media server	71
About configuring Services for Network File System (NFS) on Windows 2003 R2 SP2	73
Configuring a UNIX media server and Windows clients for backups and restores that use Granular Recovery Technology (GRT)	78
Configuring a different network port for NBFSD	78
Disk storage units supported with Exchange Granular Recovery Technology (GRT)	79
Configuring the Exchange hosts for a backup that uses Granular Recovery Technology (GRT)	79
Disabling the cataloging for duplications of Exchange backups using Granular Recovery Technology (GRT)	82
Allowing an Exchange server to browse a backup or to redirect a restore to another server or DAG	83
Cataloging an Exchange backup or VMware backup that uses Granular Recovery Technology (GRT)	85
Configuring the logon account for the NetBackup Client Service when upgrading to NetBackup 7.6	85

Chapter 5

Configuring Exchange backup policies (non-VMware)	89
About Exchange automatic, user-directed, and manual backups	89
About configuring a backup policy for Exchange Server	90
Policy recommendations for Exchange Server 2010 and later	91
Policy recommendations for Exchange Server 2007 backups	93
About policy attributes for NetBackup for Exchange	95
Adding schedules to a NetBackup for Exchange policy	97
Adding clients to a NetBackup for Exchange policy	100
Adding backup selections to an Exchange policy	101
About Exchange backups and transaction logs	109
About configuring snapshot backups of Exchange Server	110
About snapshot backups with Exchange Server	112
Limitations of Exchange snapshot operations	113
Configuration requirements and recommendations for the Exchange Server when performing snapshot operations	113

Consistency checks on Exchange snapshot backups	114
Configuring a snapshot policy for Exchange Server	115
About configuring Instant Recovery backups of Exchange Server	122
About Exchange Instant Recovery methods	123
Policy recommendations for Exchange Instant Recovery	125
Limitations for Exchange Instant Recovery operations	126
About Storage Foundations for Windows (SFW) and Exchange Instant Recovery	126
About configuration requirements for the Exchange Server when you use Instant Recovery	127
About Exchange Instant Recovery with the Microsoft VSS Provider	127
Configuring an Exchange snapshot policy with Instant Recovery	128
Configuring streaming backups of Exchange Server (Exchange 2007)	133
Notes and limitations for creating a backup selections list for Exchange 2007 streaming database backups	135
Performing a manual backup for an MS-Exchange-Server policy	136

Chapter 6

Performing backups and restores of Exchange Server, mailboxes, and public folders	137
About user-directed backups of Exchange Server data	137
About selecting a source client for an Exchange Server backup operation	138
Options for user-directed Exchange backups	139
Performing user-directed snapshot backups of Exchange Server	139
Performing user-directed streaming backups of Exchange Server (Exchange 2007)	141
Performing user-directed full streaming backups (Exchange 2007)	142

Chapter 7

Performing restores of Exchange Server, mailboxes, and public folders	145
About Exchange server-directed and redirected restores	146
About selecting a destination client for an Exchange Server restore operation	147
About restoring Exchange database data	148
About existing Exchange Server transaction logs	149
About restoring Exchange snapshot backups	150
Options for Exchange snapshot restores	151

Performing a snapshot restore of a Database Availability Group (DAG)	152
Performing a snapshot restore of an Exchange 2010 standalone server	155
Recovering an Exchange 2007 Local Continuous Replication (LCR) environment	156
Recovering an Exchange 2007 Clustered Continuous Replication (CCR) environment	157
Redirecting an Exchange 2010 Database Availability Group (DAG) snapshot backup to another database or to the recovery database (RDB)	158
Redirecting an Exchange 2010 or later standalone server snapshot backup to another database or to the recovery database (RDB)	162
Performing a snapshot restore of an Exchange 2007 or earlier server	166
Redirecting an Exchange 2007 snapshot backup to a storage group	167
Redirecting an Exchange 2007 snapshot backup to the recovery storage group	170
About redirecting restores of Exchange 2003 snapshot backup images	173
Manually mounting an Exchange database after a restore	173
About restoring streaming backups of Exchange Server (Exchange 2007 and earlier)	173
Options for streaming restores of Exchange databases	174
Restoring storage groups or storage group databases from a streaming backup	175
Redirecting an Exchange 2007 or Exchange 2003 streaming backup to a recovery storage group	177
About restoring individual Exchange mailbox and public folder items	180
About special characters in Exchange mailbox folders and message subjects	181
Prerequisites and operational notes for restoring Exchange individual mailboxes, mailbox folders, public folders, or messages	181
Options for restores of Exchange Server mailbox objects or public folder objects	182
Restoring Exchange mailbox or public folder objects	182
About redirecting a restore of Exchange mailbox or public folder objects to a different path	186

	About using the command line to browse or restore Exchange granular backup images	193
	About restoring Backup Exec Exchange images with NetBackup	193
Chapter 8	Protecting Exchange Server data with VMware backups	195
	About protecting Exchange Server data with VMware backups	195
	About the Symantec VSS provider for vSphere	196
	Support for VMware backups that protect Exchange Server	196
	Limitations of using a VMware policy to protect Exchange Server	197
	About configuring VMware backups that protect Exchange Server	198
	Installing the Symantec VSS provider for vSphere	199
	Configuring Granular Recovery Technology (GRT) with a VMware backup that protects Exchange	200
	About configuring VMware policies to protect Exchange Server	203
	Configuring a VMware policy to back up Exchange Server	204
	Configuring a VMware policy to back up Exchange Server using Replication Director to manage snapshot replication	206
	Configuring NetBackup with access to the CIFS share on the NetApp disk array	207
	About restoring Exchange data from a VMware backup	209
	Enabling protection of passive copies of the Exchange database with VMware backups	210
Chapter 9	Recovering an Exchange database to a repaired or an alternate Exchange server	213
	About recovery of Exchange databases	213
	Recovering an Exchange database	214
Chapter 10	Troubleshooting backups and restores of Exchange Server	217
	About NetBackup for Exchange debug logging	218
	Enabling the debug logs for a NetBackup for Exchange client automatically	218
	Debug logs for NetBackup for Exchange backup operations	219
	Debug logs for NetBackup for Exchange restore operations	219
	Symantec VSS provider logs	222
	Setting the debug level on a NetBackup for Exchange Windows client	223

Viewing Event Viewer logs on an off-host Exchange server	224
Connecting to the remote Exchange server from within Event Viewer	224
About installing the Exchange System Management Tools on the remote server	224
About NetBackup status reports	225
Viewing the progress report of a NetBackup for Exchange operation	225
Exchange Server transaction log truncation errors	225
Troubleshooting LCR, CCR, and Database Availability Group (DAG) recovery	226
Troubleshooting an Exchange mailbox operation with a status 5 error with bprestore	226
Dynamic enforcement of path length limit for Exchange backups and restores	226
Troubleshooting Exchange snapshot operations	227
Troubleshooting Exchange jobs that use Granular Recovery Technology (GRT)	227
About concurrent restore of multiple storage groups	228
Increased memory usage with Exchange 2010	229
Finding the virtual Database Availability Group (DAG) node	229
Displaying and resetting the Backup Status for a Database Availability Group (DAG)	229
Troubleshooting VMware backups and restores of Exchange Server	230

Appendix A

Configuring mailbox and public folder operations (Exchange 2007 and Exchange 2003)	233
About Exchange mailbox and public folder operations with MAPI	234
About configuring the account for NetBackup Exchange operations for mailbox and public folder operations	234
Configuring the logon account for the NetBackup Client Service for mailbox and public folder operations	236
About configuring Exchange Single Instance Store backups (Exchange 2007)	237
Policy recommendations for Exchange Server 2007 mailbox or public folder backups (with MAPI)	237
Configuring a policy for backups of individual Exchange mailboxes or public folders (Exchange 2007)	239
Adding backup selections to an Exchange policy for mailbox and public folder backups (Exchange 2007)	240

Notes and limitations when you create a backup selections list for mailbox and public folder backups (with MAPI)	241
About excluding Exchange items from mailbox and public folder backups (Exchange 2007)	242
Configuring exclude lists for Exchange clients in mailbox and public folder backup policies	243
Using wildcards in an Exchange backup selections list for mailbox or public folder backups	244
Performing user-directed backups of individual mailboxes and public folders with MAPI (Exchange 2007)	246
Restoring Exchange mailbox or public folder objects from mailbox or public folder backups	248
Redirecting mailbox or public folder object from a mailbox backup	250
Debug logs for NetBackup for Exchange mailbox and public folder backup and restore operations	252
Appendix B NetBackup Legacy Network Service	253
Configuring the logon account for the NetBackup Legacy Network Service (Exchange 2010)	253
Index	255

Introducing NetBackup for Exchange

This chapter includes the following topics:

- [About NetBackup for Exchange](#)
- [Features of NetBackup for Exchange](#)
- [NetBackup for Exchange terminology](#)
- [About user interface terminology](#)
- [NetBackup documentation](#)

About NetBackup for Exchange

NetBackup for Microsoft Exchange Server extends the capabilities of NetBackup to include online backups and restores of Exchange databases when Exchange Server is installed. This capability is provided as an add-on or extension to the NetBackup for Windows client software. Because this product is tightly integrated with the Backup, Archive, and Restore interface, this topic only gives an overview of NetBackup functionality. In general, backup and restore operations for Exchange files are identical to other NetBackup file operations.

Features of NetBackup for Exchange

[Table 1-1](#) describes the features of the NetBackup for Exchange Server agent.

Table 1-1 NetBackup for Exchange Server features

Feature	Description
Tight NetBackup integration	<p>Tight integration with NetBackup allows for the following:</p> <ul style="list-style-type: none"> ■ An administrator already familiar with NetBackup procedures and software can easily configure and use NetBackup to perform Exchange Server backup and restore operations. ■ Features and strengths of the NetBackup product suite are available to the Exchange Server backup user. These features include software data compression and encryption, scheduled and user-directed operations, backups of multiple data streams, and in-line tape copy. <p>See the <i>NetBackup Administrator's Guide, Volume I</i>.</p>
Central administration	Administrators can define, back up, and restore Exchange Servers and other NetBackup client computers from a central location.
Media management	Exchange Server backups can be saved directly to a wide variety of storage devices that the NetBackup master server supports.
Minimal backup time	<p>An administrator has the choice of to perform full or incremental backups. A full backup may take considerable time, so it may be performed infrequently. In the interim, any updates that occurred since the full backup can be quickly and incrementally backed up through a transaction log backup. In the event of a failure, the full backups and incremental backups would be restored.</p> <p>During recovery, the Exchange Server updates the databases and applies each of the logged transactions to the database. After the Exchange Server recovery completes, the system is brought back to the state as it existed when the last incremental backup was performed.</p>
Exchange Server Backup methods	NetBackup supports all Exchange Server backup methods: full backups, cumulative incremental backups, and differential incremental backups. User backups function as copy backups.
Online backups	Exchange Server data and transaction logs can be backed up without taking the Exchange Server offline. Exchange services and data remain available during the Exchange Server backup.
Automated backups	Administrators can set up schedules for automatic, unattended backups for local or remote clients across the network. These backups can be full or incremental and are managed entirely by the NetBackup server from a central location. The administrator can also manually back up the clients.
Restore operations	An administrator using the Backup, Archive, and Restore interface can browse backups and select the ones to be restored.
Support for VMware backups that protect Exchange	Users can create consistent full backups of virtual machines running Exchange Server. You can restore Exchange storage groups or databases and individual database objects from a VMware image. NetBackup provides support for VMware policies that use Replication Director to manage snapshots and snapshot replicas (storage lifecycle policy).

Table 1-1 NetBackup for Exchange Server features (*continued*)

Feature	Description
Exchange 2010 and 2013 standalone server and DAG support	<p>NetBackup for Exchange supports backups of Exchange 2010 and Exchange 2013 standalone servers and Database Availability Groups (DAGs). VSS is the only backup Microsoft supports of Exchange 2010 and 2013 backups.</p> <p>For a DAG, NetBackup supports backups of the active and the passive VSS writer of a Database Availability Group (DAG). When NetBackup backs up the data that is replicated the benefit is that I/O impact is reduced on the active Exchange server. NetBackup accesses the replicated data and leaves the active (or live) Exchange server alone. NetBackup can back up the passive copy on a specific server, based on the list of preferred servers.</p>
Exchange 2007 backup and restore features	<p>NetBackup can back up and restore storage groups and databases within the storage group. The capabilities of this feature are as follows:</p> <ul style="list-style-type: none"> ■ Scheduled backups of individual storage groups and databases ■ User-directed backups of individual storage groups and databases ■ Restores of individual storage groups and databases. You can perform these restores with the Backup, Archive, and Restore interface (on the server or on the client). Or you can use the Remote Administration Console for Windows or UNIX.
Enhancements to consistency checks of snapshot backups	<p>For snapshot backups, NetBackup uses the Microsoft consistency check API to check the consistency of databases and transaction logs and to provide additional details. This speeds up a snapshot backup, because it allows the backup to proceed in parallel with the consistency check. For an Exchange 2010 and later DAG, you can disable the consistency check or ignore the check and continue with the backup.</p>
Snapshot backups and restores	<p>NetBackup for Exchange can perform Exchange 2007 and later backups and with snapshot methodology. With a separate Snapshot Client license, you can perform off-host backups, Instant Recovery backups, and backups with a hardware provider.</p> <p>See “About snapshot backups with Exchange Server” on page 112.</p>
Restores of individual items using Granular Recovery Technology (GRT)	<p>Note: <i>Reviewer: Added 11/29/12</i></p> <p>NetBackup 7.6 does not support GRT with Exchange 2013.</p> <p>When a backup uses GRT, users can restore individual mailbox and public folder items directly from any full database backup.</p> <p>See “About Exchange backups and Granular Recovery Technology (GRT)” on page 42.</p>
Redirected restores of mailbox objects	<p>You can restore mailboxes, mailbox folders, mailbox messages, public folders, and public folder items to a new location.</p>
Redirected restores of databases or storage groups	<p>Exchange 2007 and later backups can be restored to another database or another storage group on the local server or on a different server. Exchange 2003 snapshot backups can be restored to an identical storage group on a different server.</p>

Table 1-1 NetBackup for Exchange Server features (*continued*)

Feature	Description
Redirection to the recovery database (RDB) or recovery storage group (RSG)	Exchange 2007 and later backups can be redirected to the recovery database or RSG. Streaming backups of Exchange 2003 can be redirected to the RSG.
Compression of backups	Compression increases backup performance over the network and reduces the size of the backup image that is stored on the disk or tape. NetBackup does not support GRT for any backups that use compression.
Encryption	When the Encryption attribute is enabled, the server encrypts the backup for the clients that are listed in the policy. NetBackup does not support GRT for any backups that use encryption.
Cluster support	The NetBackup for Exchange Server agent supports Microsoft Cluster Server (MSCS) environment and Veritas Cluster Server (VCS). See the <i>NetBackup Enterprise Server 7.6 Cluster Compatibility</i> list. This list contains information on the versions of Exchange Server that are supported with the cluster environments.
LCR/CCR support	NetBackup for Exchange with Snapshot Client supports backups of the passive VSS writer of an Exchange 2007 LCR and CCR configuration. NetBackup can back up the data that is replicated by interfacing with the replica (or passive) Exchange server. The benefit of such a backup is to reduce I/O impact on the active Exchange server. NetBackup accesses the replicated data and leaves the active (or live) Exchange server alone. This type of backup is especially beneficial for a backup of a CCR node because the active node is completely left out of the backup. VSS is the only backup Microsoft supports of this replicated data.
Public folder backup and restore (with MAPI)	<p>With Exchange 2007, users can perform backups and restores of individual public folder items (with MAPI), as follows:</p> <ul style="list-style-type: none"> ■ Scheduled backups of individual folders ■ User-directed backups of individual folders ■ Restores of individual folders or documents. You can perform this type of restore can with the Backup, Archive, and Restore interface (on the server or on the client). Or you can use the Remote Administration Console.
Mailbox backup and restore (with MAPI)	<p>With Exchange 2007, users can perform backups and restores of individual mailboxes and folders (with MAPI), as follows:</p> <ul style="list-style-type: none"> ■ Scheduled backups of individual mailboxes and folders ■ User-directed backups of individual mailboxes and folders ■ Restores of individual mailboxes, folders, or messages. You can perform this type of restore with the Backup, Archive, and Restore interface (on the server or on the client). Or you can use the Remote Administration Console.

Table 1-1 NetBackup for Exchange Server features (*continued*)

Feature	Description
Single Instance Storage (SIS) of mailbox message attachments	This feature applies only to Exchange 2007 mailbox backups with MAPI. Users can enable Single Instance Storage for message attachments so that NetBackup writes only one copy of an attachment to the backup.
Exchange 2003	Exchange 2003 backups are no longer supported with NetBackup 7.6. This release includes support for the following Exchange 2003 recovery operations: <ul style="list-style-type: none">■ Restores of storage groups and databases within the storage group.■ Restores of Exchange objects with snapshot methodology.■ Snapshot backups can be restored to an identical storage group on a different server.■ Streaming backups can be redirected to the RSG.■ Public folder restore (with MAPI).■ Mailbox restore (with MAPI).■ Single Instance Storage (SIS) of mailbox message attachments.

NetBackup for Exchange terminology

Table 1-2 NetBackup for Exchange terminology

Term	Definition or description
Exchange Server, Exchange	In the <i>NetBackup for Microsoft Exchange Server</i> documentation, “Microsoft Exchange Server” is referred to as “Exchange Server” or “Exchange”.
Granular Recovery Technology (GRT)	Allows a user to restore individual mailbox and public folder items from full database backups.
Mailbox or public folder backups and restores (with MAPI)	Refers to any mailbox and public folder operations that are performed with MAPI. This type of backup is only available with Exchange 2007. This type of restore is only available with Exchange 2007 and 2003.
Microsoft consistency check API	Refers to the Microsoft CHKSGFILS API or interface.
NetBackup Exchange operations account	<i>Reviewer: Added 11/19/12</i> A unique Exchange mailbox that has permissions to perform backups and restores.
NetBackup File System daemon (NBFSD)	The NetBackup File System daemon on the NetBackup media server is a process that allows NetBackup clients to mount, browse, and read tar images. This process is used with a client for GRT operations. These operations include backups, browsing for backup images, restores, and duplication.

Table 1-2 NetBackup for Exchange terminology (*continued*)

Term	Definition or description
NetBackup for Microsoft Exchange Server	In the <i>NetBackup for Microsoft Exchange Server</i> documentation, “NetBackup for Microsoft Exchange Server” is referred to as “NetBackup for Exchange Server” or “NetBackup for Exchange”.
Snapshot	Refers to backups and restores performed with snapshot technology. In the NetBackup for Exchange Server documentation, “VSS” is synonymous with “snapshot”.
Streaming backups and restores	Refers to Exchange database backups and restores that use the Microsoft Exchange Backup and Restore API and not snapshot technology or the VSS provider.
VSS	Refers to the software provider used to perform snapshot backups and restores. In the NetBackup for Exchange Server documentation, “snapshot” is synonymous with “VSS”.

About user interface terminology

You perform many configuration steps from the NetBackup Administration Console on the master server. The type of console available depends on your master server platform. NetBackup supports a Java interface for both Windows and UNIX master servers. In addition, NetBackup supports a Windows interface for Windows master servers.

The Java and Windows interfaces are nearly identical. If interface differences exist in the configuration procedures, the term “Windows” or “Java” appears in the procedure to differentiate between the two interfaces.

NetBackup documentation

NetBackup documentation is part of the NetBackup media kit and can be found in a directory on the installation DVD for each release platform.

The documents are in Adobe® Portable Document Format (PDF), viewable with the Adobe Acrobat Reader. Download the reader from <http://www.adobe.com>.

Symantec Corporation assumes no responsibility for the installation and use of the reader.

For a complete list of NetBackup technical documents, see the Related Documents appendix in the *NetBackup Release Notes*.

The Symantec Corporation support Web site contains links to the most recent documentation plus a list of helpful how-to and product alert topics.

Installing NetBackup for Exchange

This chapter includes the following topics:

- [Planning the installation of NetBackup for Exchange](#)
- [Verifying the operating system and platform compatibility for NetBackup for Exchange](#)
- [NetBackup server requirements for NetBackup for Exchange](#)
- [NetBackup client requirements for NetBackup for Exchange](#)
- [Exchange server software requirements for NetBackup for Exchange](#)
- [Requirements for an Exchange 2007 server in a VCS 5.0 environment](#)
- [Snapshot Client configuration and licensing requirements for Exchange snapshot backups](#)
- [About license keys for NetBackup for Exchange](#)

Planning the installation of NetBackup for Exchange

Perform the following tasks before you use NetBackup for Exchange.

Table 2-1 Installation steps for NetBackup for Exchange

Step	Action	Description
Step 1	Verify the operating system and platform compatibility.	See “Verifying the operating system and platform compatibility for NetBackup for Exchange” on page 24.

Table 2-1 Installation steps for NetBackup for Exchange (*continued*)

Step	Action	Description
Step 3	Verify the Exchange software requirements for NetBackup for Exchange.	See “ NetBackup server requirements for NetBackup for Exchange ” on page 25. See “ NetBackup client requirements for NetBackup for Exchange ” on page 25.
Step 4	For snapshot operations, verify the requirements for this type of backup.	See “ Snapshot Client configuration and licensing requirements for Exchange snapshot backups ” on page 27.
Step 5	If you installed Exchange Server in a cluster, review the requirements for that environment.	See “ Requirements for an Exchange 2007 server in a VCS 5.0 environment ” on page 27.
Step 6	Add the applicable license key(s) to the master server.	See “ About license keys for NetBackup for Exchange ” on page 29.

Verifying the operating system and platform compatibility for NetBackup for Exchange

Verify that the NetBackup for Exchange agent is supported on your operating system or platform.

To verify operating system and compatibility

- 1 Go to the Symantec Support Web page:
<http://www.symantec.com/business/support/index.jsp>
- 2 Click on the link for **NetBackup Enterprise Server**.
- 3 In the list of documents, click on the following document:
NetBackup Database Agent Compatibility List
- 4 For information on supported cluster environments for NetBackup for Exchange, see the following document:
NetBackup Cluster Compatibility List
- 5 For information on support for Snapshot Client, see the following document:
NetBackup Snapshot Client Compatibility List
- 6 For information on support for VMware, see the following document:
[Statement of Support for NetBackup in a Virtual Environment \(Virtualization Technologies\)](#)

NetBackup server requirements for NetBackup for Exchange

To use the new features that are included in NetBackup for Exchange in NetBackup 7.6, you must upgrade your NetBackup for Exchange clients. The media server and NetBackup for Exchange clients must be at the same NetBackup version.

Verify that the following requirements are met for the NetBackup server:

- The NetBackup server software is installed and operational on the NetBackup server. The NetBackup server platform can be any that NetBackup supports. See the *NetBackup Installation Guide*.
- If you use an Exchange granular proxy host, the NetBackup media server and the client must use the same version of Windows.
- Make sure that you configure any backup media that the storage unit uses. The number of media volumes that are required depends on several things:
 - The devices used
 - The sizes of the databases that you want to back up
 - The amount of data that you want to archive
 - The size of your backups
 - The frequency of backups or archivesSee the *NetBackup Administrator's Guide, Volume I*.

NetBackup client requirements for NetBackup for Exchange

This topic describes where you need to install the NetBackup client and the version required to perform backups of Exchange server.

- To use the new features that are included in NetBackup for Exchange in NetBackup 7.6, you must upgrade your NetBackup for Exchange clients. The media server and NetBackup for Exchange clients must be at the same NetBackup version.
- *Reviewer: Updated 10/22/12*
Some situations require that the clients or the media server and clients have the same version of Windows, as follows:
 - When you use an Exchange granular proxy host
 - Off-host backups

- When you use a private network
- When you redirect a restore to a different client
- When you select a destination client other than the source client when you browse the backup image
- *Reviewer: Updated 10/22/12*
Install the NetBackup client software on the following:
 - The Exchange mailbox servers, or on all VMs that are Exchange mailbox servers
 - *Reviewer: Larry, you said this requirement is specific to GRT. Should we specifically state "If you plan to use GRT, any CAS servers..."*
(Exchange 2010) Any CAS servers that perform browse or restore operations
The following PowerShell command can be used to change which CAS server is assigned to a database. Refer to Microsoft documentation for more information.

```
Set-MailboxDatabase <Mailbox Database Name>  
-RpcClientAccessServer <ClientAccessServer or  
ClientAccessServerArrayID>
```
 - Each node in the Exchange cluster or DAG
 - (Non-VMware backups) Any off-host clients
- *Reviewer: Added 10/22/12*
For VMware operations, when you upgrade the client software you must install the latest version of the Symantec VSS provider. If you have an existing version of the provider, you must first uninstall the old version.

Exchange server software requirements for NetBackup for Exchange

Verify the following regarding the Exchange server software on the NetBackup server or client:

- Exchange server software must be installed and operational.
- (Exchange 2007), Symantec recommends that you do not install Microsoft Outlook on the same server on which Exchange is installed. This recommendation does not apply if you do not perform restores with Granular Recovery Technology (GRT) or if you perform mailbox backups (with MAPI).
- For NetBackup software requirements for the Exchange server, see the following:

See “[NetBackup server requirements for NetBackup for Exchange](#)” on page 25.
See “[NetBackup client requirements for NetBackup for Exchange](#)” on page 25.

- (Exchange 2007) This requirement applies if you want to perform operations with GRT or MAPI. On the Exchange Server install the Microsoft Exchange Server MAPI Client and Collaboration Data Objects (CDO) package. On Windows 2008 and later, install version 6.05.8022.0 or higher. On Windows 2003 and later, install version 6.05.7888 or higher.

These packages are available on the following Microsoft website:

<http://www.microsoft.com/downloads/>

- The Exchange Server does not need to be installed on the off-host client.

Requirements for an Exchange 2007 server in a VCS 5.0 environment

If you plan to use NetBackup for Exchange to back up an Exchange 2007 server in a VCS 5.0 environment, a patch is required. See the following article for more information:

<http://www.symantec.com/docs/TECH51616>

Snapshot Client configuration and licensing requirements for Exchange snapshot backups

To perform snapshot backups of restores of Exchange Server, you must meet the following configuration and licensing requirements:

- Confirm that the type of snapshot you want to configure is supported for your Exchange environment. See the following compatibility list:
NetBackup Snapshot Client (Advanced Client) OS, Arrays, and Database Agent Compatibility
- Configure the NetBackup Snapshot Client and verify that you meet the configuration requirements for the snapshot method you want to use. See the *NetBackup Snapshot Client Administrator's Guide*.
- If you use Veritas Storage Foundation for Windows (SFW), verify that you have the supported software level.

Windows 2008 and later, SFW 5.1 SP1
Windows 2008 R2 and later

Windows 2003 x64 SFW 5.0

Windows 2003 x86

SFW 4.3

- The following snapshot options or Exchange configurations require a separate Snapshot Client license:
 - Instant recovery
 - Off-host backups
 - Backups using a hardware provider
 - A CCR environmentA Snapshot Client license key is not required for any Exchange snapshot backups that use the Microsoft default provider or SFW.
- Additional installation requirements apply for Instant Recovery and off-host backups.

See “Requirements for Exchange off-host backups” on page 28.

See “Requirements for Exchange Instant Recovery backups” on page 29.
- If you want to restore individual items from database backups (granular recovery), additional installation requirements apply and other configuration is necessary.

See “Configuring an Exchange backup that uses Granular Recovery Technology (GRT) (non-VMware backups)” on page 56.

Requirements for Exchange off-host backups

Note the following requirements and operational notes for off-host backups:

- (Exchange 2007, Windows 2003 x64) To successfully perform backups with the SFW VSS provider for SFW 5.0, apply the following hotfixes on the hosts where a snapshot backup occurs:
 - <http://www.symantec.com/docs/TECH56286>

This hotfix is also included in the SFW 5.0 MP1 release.
 - <http://www.symantec.com/docs/TECH54364>
- Exchange does not need to be installed on the off-host client.
- For consistency checks of Exchange with the Microsoft consistency check API, Symantec recommends that you install the Exchange System Management Tools on the alternate client. Then restart the Exchange Server. If you choose not to install the Exchange System Management Tools on an Exchange 2010 or later alternate client, you must install the VC9 runtime DLLs. These DLLs can be downloaded from Microsoft x64 VC9 download page:

<http://www.microsoft.com/downloads/details.aspx?familyid=BD2A6171-E2D6-4230-B809-9A8D7548C1B6&displaylang=en>

More information is available about consistency checks:

See “[Consistency checks on Exchange snapshot backups](#)” on page 114.

See “[About consistency checks options for an Exchange 2010 or later backup](#)” on page 39.

- For Instant Recovery off-host backups, see the following requirements:
See “[Requirements for Exchange Instant Recovery backups](#)” on page 29.

Requirements for Exchange Instant Recovery backups

With Windows 2008 and later and Windows 2008 R2 and later, Instant Recovery backups require Storage Foundations for Windows (SFW) 5.1 SP1 if you use the SFW VSS provider.

About license keys for NetBackup for Exchange

The NetBackup for Exchange agent is installed with the NetBackup client software. No separate installation is required. A valid license for the agent must exist on the master server.

More information is available on how to add license keys.

See the *NetBackup Administrator's Guide, Volume I*.

In a NetBackup cluster, add the key on each node where the NetBackup server is installed.

To use NetBackup for Exchange and the features that are supported with the agent, you need the following keys.

Backup type or feature	License required
NetBackup for Exchange agent	NetBackup for Exchange
Instant recovery, off-host backups, backups using a hardware provider, CCR environment	Snapshot Client
VMware backups that protect Exchange	Enterprise Client
Replication Director	NetBackup Replication Director (this option enables Snapshot Client, OpenStorage Disk, and Replication Director)
Accelerator	Data Protection Optimization Option

DRAFT

Configuring Exchange client host properties

This chapter includes the following topics:

- Configuring Exchange client host properties
- Exchange properties
- About configuring a pause in consistency checks for Exchange 2007
- About backing up all or only uncommitted Exchange transaction log files with snapshot backups
- Configuring the Exchange granular proxy host
- About truncating Exchange transaction logs with Instant Recovery backups
- Truncating Exchange transaction logs by performing a backup to a storage unit
- About consistency checks options for an Exchange 2010 or later backup
- About the Exchange credentials in the client host properties

Configuring Exchange client host properties

Reviewer: I removed the note that the host properties do not apply to VMware backups. Instead, the user needs to look at the individual properties to see what fits their situation. 1/22/13

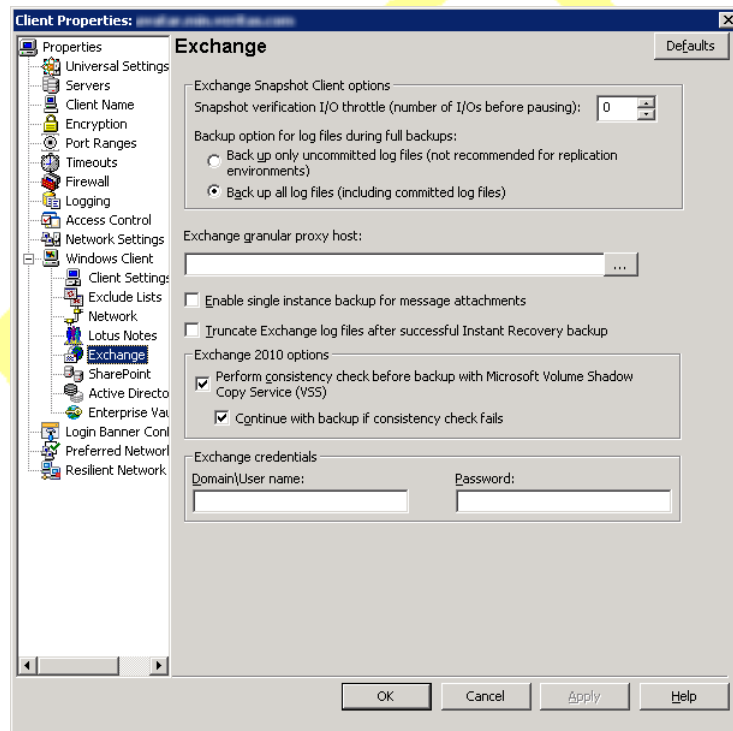

In the Exchange client host properties you configure settings for the Exchange clients you selected.

To configure Exchange client host properties

- 1 Open the NetBackup Administration Console or the Remote Administration Console.
- 2 In the left pane, expand **NetBackup Management > Host Properties > Clients**.
- 3 In the right pane, select the Exchange client(s) you want to configure.
 If the client does not appear in the list, click **Actions > Configure Client**.

Note: For clustered or replicated environments, select each node. You must configure the same settings on each node. If you change the attributes for the virtual name of the client, only the active node or current node is updated.

- 4 Click **Actions > Properties**.
- 5 Expand **Windows Client** and click **Exchange**.

- 6 Enable the options you want.
 See “Exchange properties” on page 33.
- 7 Click OK.

Exchange properties

The **Exchange** properties apply to the currently selected Windows clients. For clustered or replicated environments, configure the same settings for all nodes. If you change the attributes for the virtual server name, only the active node is updated.

Reviewer: I removed the note that the host properties do not apply to VMware backups. Instead, the user needs to look at the individual properties to see what fits their situation. Does this make it more clear which properties apply to which situations, rather than trying to cover it all in a single note? 1/22/13

The **Exchange** dialog box contains the following properties.

Table 3-1 Exchange dialog box properties

Property	Description
Snapshot verification I/O throttle	<p>Note: This property only applies to MS-Exchange-Server backup policies.</p> <p>This option applies to off-host Exchange 2007 snapshot backups if the Exchange System Management Tools are not installed on the alternate client. Specify the number of I/Os to process for each 1-second pause.</p> <p>See “About configuring a pause in consistency checks for Exchange 2007” on page 36.</p>
Backup option for log files during full backups	<p>Note: This property only applies to MS-Exchange-Server backup policies.</p> <p>Choose which logs to include with snapshot backups:</p> <ul style="list-style-type: none">■ Back up only uncommitted log files Select this option to back up only the log files that are uncommitted. This option is not recommended for DAGs or Exchange 2007 CCR environments.■ Back up all log files (including committed log files) <p>See “About backing up all or only uncommitted Exchange transaction log files with snapshot backups” on page 36.</p>

Table 3-1 Exchange dialog box properties (*continued*)

Property	Description
Truncate log after successful Instant Recovery backup	<p>Note: This property only applies to MS-Exchange-Server backup policies.</p> <p>Enable this option to delete transaction logs after a successful Instant Recovery backup. By default, transaction logs are not deleted for a full Instant Recovery backup that is snapshot only.</p> <p>See “About truncating Exchange transaction logs with Instant Recovery backups” on page 38.</p>
Exchange granular proxy host	<p>Note: <i>Reviewer: Added this note and made it clear that this property applies not just to duplication operations but also bplist operations. 1/22/13</i></p> <p>This property applies when you duplicate or browse a backup that uses Granular Recovery Technology (GRT).</p> <p>You can specify a different Windows system to act as a proxy for the source client when you duplicate or browse a backup (using <code>bplist</code>) that uses GRT. Use a proxy if you do not want to affect the source client or if it is not available.</p> <p>See “Configuring the Exchange granular proxy host” on page 37.</p> <p>See “Exchange granular clients and non-VMware backups ” on page 43.</p> <p>See “Exchange granular clients and VMware backups” on page 44.</p>
Enable single instance backup for message attachments	<p>Note: This property only applies to MS-Exchange-Server backup policies.</p> <p>Enable this option to back up the data that is stored on a Single Instance Store (SIS) volume. This feature only applies to mailbox and public folder backups with Exchange Server 2007.</p> <p>See “About configuring Exchange Single Instance Store backups (Exchange 2007) ” on page 237.</p>
Perform consistency check before backup with Microsoft Volume Shadow Copy Service (VSS)	<p>Note: This property only applies to MS-Exchange-Server backup policies.</p> <p>Disable this option if you do not want to perform a consistency check during a DAG backup. If you check Continue with backup if consistency check fails, NetBackup continues to perform the backup even if the consistency check fails.</p> <p>See “About consistency checks options for an Exchange 2010 or later backup” on page 39.</p>

Table 3-1 Exchange dialog box properties (*continued*)

Property	Description
Exchange credentials	<p>Note the following for this property:</p> <ul style="list-style-type: none">■ This property applies to MS-Exchange-Server backup policies.■ This property applies if you use Replication Director to manage your VMware snapshots and snapshot replication.■ <i>Reviewer: ET3064051 Added 1/30/13</i> This property does not apply to mailbox or public folder backups. Instead, you must configure the NetBackup Client Service with the credentials for the account for NetBackup Exchange operations. See “Configuring the logon account for the NetBackup Client Service for mailbox and public folder operations” on page 236. <p>Provide the credentials for the account for NetBackup Exchange operations. This account must have the necessary permissions to perform Exchange operations. The permissions that are required depend on the Exchange version that you have.</p> <p>See “About the Exchange credentials in the client host properties” on page 39.</p> <p>See “About configuring the account for NetBackup Exchange operations” on page 46.</p> <p>Different requirements exist if you use Replication Director to manage your VMware snapshots and snapshot replication. In that case you <i>must</i> provide the Exchange account credentials in the Exchange client host properties. The account also needs the privilege to “Replace a process level token.” The logon account for the NetBackup Client Service must be an account that has access to the CIFS shared that are created on the NetApp disk array.</p> <p>See “Configuring NetBackup with access to the CIFS share on the NetApp disk array” on page 207.</p> <p><i>Reviewer: Added 1/2/13</i></p> <p>In previous versions of NetBackup, to perform operations with Granular Recovery Technology (GRT) you configured the NetBackup Client Service and the NetBackup Legacy Network Service (Exchange 2010 or later) with a different logon account. Customers upgrading from earlier versions of NetBackup can continue to use that configuration. If you add the credentials in the host properties, do not configure the logon account for the NetBackup Client Service or the NetBackup Legacy Network Service.</p>

About configuring a pause in consistency checks for Exchange 2007

Note:

Reviewer: Updated 8/2/12

This option only applies to off-host Exchange 2007 backups when the Exchange Management Console is not installed on the alternate client.

The value is used during snapshot validation by the Exchange command `ESEUTIL /pxxx` where `xxx` is the value of **Snapshot verification I/O throttle**. `ESEUTIL` defines the `/p` setting as a forced 1-second pause after every `xxx` I/Os to limit the I/O rate during database verification. See the Microsoft Exchange documentation regarding the `ESEUTIL` command for details.

For more information on how to configure client settings in the host properties, see the following topic:

See “[Configuring Exchange client host properties](#)” on page 31.

About backing up all or only uncommitted Exchange transaction log files with snapshot backups

The **Back up option for log files during full backups** determines how many log files are backed up during a full or user-directed snapshot backup. You can adjust this setting in the host properties for the Exchange client.

If you select **Back up only uncommitted log files** NetBackup only backs up and catalogs the transaction log files that were not committed to the Exchange database at the time that the snapshot was taken. Exchange requires these uncommitted log files during the recovery of the Exchange database to make the database consistent. If **Back up all log files (including committed log files)** is selected, all of the log files that exist on the snapshot volume are backed up and cataloged.

Back up only uncommitted log files is not recommended for replicated environments. See the following article:

<http://www.symantec.com/docs/TECH88101>

When you back up only the uncommitted log files, the advantage is that less space is needed on the storage unit for the transaction logs. When you back up all of the log files, the advantage is that a consecutive set of log files is maintained. A previous full backup can use these log files for rolling forward. These options do not affect the ability to recover the current full or user-directed type backup.

These options do affect the ability to roll forward from a previous full or user-directed type backup.

For example, consider if a full backup is performed, followed by two differential backups, followed by another full backup. If **Back up all log files** is specified, all of the log files exist in backup images. The first full backup, the log files from the two differential backups, and the log files from the second full backup can be restored. The existence of all the log files allows for a roll-forward recovery. If you select **Back up only uncommitted log files**, a gap exists in the sequence of transaction logs that are in the backup images. From the full backup, you can restore only as far as the time that is covered in the two differential backups.

For more information on how to configure the client host properties, see the following topic:

See [“Configuring Exchange client host properties”](#) on page 31.

Configuring the Exchange granular proxy host

When you browse for or restore individual items using Granular Recovery Technology (GRT), NetBackup uses the destination client to stage a virtual copy of the database that you want to restore. However, NetBackup uses the source client of the backup to stage the database in the following situations: when you duplicate or browse a backup (using `bplist`) that uses GRT. Alternatively, you can specify a different Windows system to act as a proxy for the source client.

Specify a proxy host for a duplication or browse operation if one of the following situations apply:

- You do not want to affect the source client
- The source client is not available
- You want to use a different proxy host than the one specified in the host properties for the source client

An Exchange granular proxy host has the following requirements:

- Has the same NetBackup version as the Exchange hosts
- Uses the same NetBackup master server as the Exchange hosts
- Is included in the Exchange hosts

You do not need to add the proxy host to the list of Exchange hosts if the proxy host is not a NetBackup master or a media server.

The `-granular_proxy` option is included with the `bpduplicate` command and the `bplist` command. You can override the **Exchange granular proxy host** setting

with the `-granular_proxy` option. More information is available on how to specify the granular host with these commands.

See [“About using the command line to browse or restore Exchange granular backup images”](#) on page 193.

NetBackup determines the granular proxy host in the following order:

- The host that is specified with the `-granular_proxy` option on the command line
- The granular proxy host that you specify in the host properties for the source client
- The source client

To specify a proxy, configure the **Exchange granular proxy host** in the Exchange properties for the client. More information is available about how to configure the client host properties.

See [“Configuring Exchange client host properties”](#) on page 31.

About truncating Exchange transaction logs with Instant Recovery backups

By default, Exchange transaction logs are **not** truncated for a full Instant Recovery backup that **does not** back up to a storage unit. To truncate logs enable **Truncate log after successful Instant Recovery backup** in the Exchange properties for the client. **Consider carefully before** you select this option. Ensure that you have an **independent method to retain** your snapshots for disaster recovery. Alternatively, **you can perform a full Instant Recovery backup** to a storage unit.

See [“Truncating Exchange transaction logs by performing a backup to a storage unit”](#) on page 39.

For more information on how to configure the client host properties, see the following topic:

See [“Configuring Exchange client host properties”](#) on page 31.

Truncating Exchange transaction logs by performing a backup to a storage unit

To truncate Exchange transaction logs by performing a backup to a storage unit

- 1 Create a new backup policy.
- 2 Create a full or a differential schedule type.
- 3 In the attributes for the schedule, select **Snapshots and copy snapshots to a storage unit**.
- 4 Select a storage unit for the policy.
- 5 Perform a snapshot backup with this policy.

About consistency checks options for an Exchange 2010 or later backup

By default, NetBackup is configured to run a consistency check on Exchange 2010 or later backups. The consistency check that runs on the snapshot determines if possible data corruption exists. For standalone servers, you must perform a consistency check. Consistency checks are optional for a Database Availability Group (DAG). You can configure this option in the host properties for the Exchange client.

If **Perform consistency check before backup with Microsoft Volume Shadow Copy Service (VSS)** is selected, NetBackup backs up Exchange objects as follows:

- If you do not select **Continue with backup if consistency check fails**, a database backup fails if it contains database files or transaction log files that are corrupt. All other non-corrupt databases that you selected are backed up.
- When you select **Continue with backup if consistency check fails**, then all Exchange data is backed up regardless if corrupt files are detected.

For more information on how to configure client settings in the host properties, see the following topics:

See [“Configuring Exchange client host properties”](#) on page 31.

About the Exchange credentials in the client host properties

The Exchange credentials in the client host properties indicate the account that has necessary permissions to perform Exchange operations. The permissions that

are required depend on the Exchange version that you have. See the following topics:

See “Creating a privileged NetBackup user account for EWS access (Exchange 2010)” on page 50.

See “Creating a minimal NetBackup account for Exchange operations (Exchange 2010)” on page 51.

See “Configuring the account for NetBackup Exchange operations (Exchange 2007)” on page 52.

See “Configuring the account for NetBackup Exchange operations (Exchange 2003)” on page 54.

Note the following:

- *Reviewer: Is "replace a process level token" always necessary for the account used for the Exchange credentials, or only for VMware with RD? Or only for GRT browse and restore of VMware backup with RD? 12/3/12*

If you use Replication Director to manage your VMware snapshots and snapshot replication, do the following:

- Provide the Exchange credentials in the **Domain\user** and **Password** fields in the Exchange properties for the client. This account must also have the local security right “Replace a process level token.”

See “About the Exchange credentials in the client host properties” on page 39.

- *Reviewer: Removed mention of Legacy service, no need to configure if Exchange credentials are configured 12/21/12*

Configure the NetBackup Client Service with an account that has access to the CIFS shares that are created on the NetApp disk array.

- *Reviewer: New 12/21/12*

In NetBackup 7.5 and earlier, you added the credentials to the logon account for the NetBackup Client Service and the NetBackup Legacy Network Service (Exchange 2010 or later). Customers upgrading from earlier versions of NetBackup can continue to use this configuration (unless you use Replication Director). If you add the credentials in the host properties, do not configure the logon account for the NetBackup Client Service or the NetBackup Legacy Network Service.

Reviewer: ET 3064051 1/30/13

Note that for mailbox and public folder operations, you cannot configure the Exchange credentials in the host properties. Instead you must configure the logon account for the NetBackup Client Service with the credentials.

Configuring Exchange Granular Recovery (Exchange 2010 and earlier)

*Reviewer: Changed title to reflect support for GRT
1/7/13*

This chapter includes the following topics:

- About Exchange backups and Granular Recovery Technology (GRT)
- About configuring the account for NetBackup Exchange operations
- Configuring an Exchange backup that uses Granular Recovery Technology (GRT) (non-VMware backups)
- About installing and configuring Network File System (NFS) for Exchange Granular Recovery
- Disk storage units supported with Exchange Granular Recovery Technology (GRT)

- Configuring the Exchange hosts for a backup that uses Granular Recovery Technology (GRT)
- Disabling the cataloging for duplications of Exchange backups using Granular Recovery Technology (GRT)
- Allowing an Exchange server to browse a backup or to redirect a restore to another server or DAG
- Cataloging an Exchange backup or VMware backup that uses Granular Recovery Technology (GRT)
- Configuring the logon account for the NetBackup Client Service when upgrading to NetBackup 7.6

About Exchange backups and Granular Recovery Technology (GRT)

When a backup uses Granular Recovery Technology (GRT), users can restore individual items directly from any full database backup. This type of backup can serve both kinds of recovery situations. From the same backup image you can restore entire storage groups or databases. Or you can select individual folders or messages within a mailbox or public folder.

You can restore individual items using GRT from the following types of backups:

- Full or user-directed backups
NetBackup lets you create a complete policy for disaster recovery, with all the various types of schedules. However, you cannot restore individual items from an incremental backup.
- VMware backups that protect Exchange
- Local snapshot backups
- Off-host snapshot backups
- Instant recovery backups, when the schedule copies the snapshot to a storage unit
- Replica snapshot backups
This type of backup applies to LCR or to CCR environments with Exchange 2007 or a Database Availability Group (DAG) with Exchange 2010.
- Streaming backups (Exchange 2007)
This type of backup is limited to certain types of storage units. See the following document for more information:
<http://www.symantec.com/docs/TECH187917>

Exchange granular clients and non-VMware backups

Reviewer: This is a new topic I didn't flag for the first Beta review.

With streaming or snapshot backups (non-VMware backups), Exchange granular clients are those clients that perform backup or restore operations with Granular Recovery Technology (GRT). These clients have specific requirements that must be met to allow restores of individual mailbox and public folders from full database backups.

Exchange granular clients

Exchange granular clients include the following:

- All mailbox servers
- The CAS server
- Nodes in an Exchange DAG
- Nodes in a clustered Exchange server
- An off-host client

Requirements for Exchange granular clients

Each Exchange granular client requires configuration of the following:

- For a DAG or cluster, configure all the nodes. (Exchange 2010) Also configure the CAS server.
- On each node, an unassigned drive letter on which to mount the backup image
- Network File System (NFS)
- An account for NetBackup Exchange operations (unique mailbox for NetBackup)
- In the Exchange client host properties, to the **Exchange credentials** add the credentials of the account for NetBackup Exchange operations.

- Mapping of Exchange hosts

For virtual environments and if you use an off-host client, you need to create a map of the virtual names and physical names of the systems in the Exchange configuration. If you use a master or a media server as a proxy server you also need to add the proxy server to the list of hosts.

See [“Configuring the Exchange hosts for a backup that uses Granular Recovery Technology \(GRT\)”](#) on page 79.

- The client(s) and the media server must have the same version of Windows as the client from which the backup is made.
- If you use an Exchange granular proxy server, the database hosts and the proxy host must also meet the following additional requirements:

- Have the same NetBackup version
- Use the same NetBackup master server
- *Reviewer: Updated 1/14/13*
An Exchange server must have permission to browse a backup or to redirect a restore to another server or to a DAG.
See [“Allowing an Exchange server to browse a backup or to redirect a restore to another server or DAG”](#) on page 83.

Exchange granular clients and VMware backups

Reviewer: This is a new topic I didn't flag for the first Beta review.

Exchange granular clients are those clients that perform backup or restore operations with Granular Recovery Technology (GRT). This distinction is important because not all Exchange clients perform GRT operations with VMware browse and restore operations. Therefore all clients do not have the same configuration requirements.

Granular clients and VMware backups that protect Exchange 2010

With VMware backups that protect Exchange 2010, granular clients include following:

- The CAS server
- Clients that browse for backups
- Nodes in a clustered Exchange server
- An Exchange granular proxy host
See [“Configuring the Exchange granular proxy host”](#) on page 37.

Granular clients and VMware backups that protect Exchange 2007

With VMware backups that protect Exchange 2007, granular clients include following:

- Clients that browse for backups or perform restores
- Nodes in a clustered Exchange server
- *Reviewer: In the review, I omitted the granular proxy host from this list. I think this was a mistake, unless someone told me it doesn't apply to VMware backups of Exchange 2007. 1/14/12*
An Exchange granular proxy host
See [“Configuring the Exchange granular proxy host”](#) on page 37.

Requirements for Exchange granular clients

Each Exchange granular client requires configuration of the following:

- For a DAG or cluster, configure all the nodes. (Exchange 2010) Also configure the CAS server.
- *Reviewer: How should I phrase this and next bullet? I added a section about RD below. Moved "tar" image info to restore topic.*
On each node, an unassigned drive letter on which to mount the backup image.
- Network File System (NFS)
- An account for NetBackup Exchange operations (unique mailbox for NetBackup)
- The account for NetBackup Exchange operations must also have the local security privilege "Replace a process level token."
See ["Configuring local security privileges for the account for NetBackup Exchange operations"](#) on page 55.
- In the Exchange client host properties, to the **Exchange credentials** add the credentials of the account for NetBackup Exchange operations.
- Mapping of Exchange hosts
For virtual environments you need to create a map of the virtual names and physical names of the systems in the Exchange configuration. If you use a master or a media server as a proxy server you also need to add the proxy server to the list of hosts.
See ["Configuring the Exchange hosts for a backup that uses Granular Recovery Technology \(GRT\)"](#) on page 79.
- The client(s) and the media server must have the same version of Windows as the client from which the backup is made.
- If you use an Exchange granular proxy server, the database hosts and the proxy host must also meet the following additional requirements:
 - Have the same NetBackup version
 - Use the same NetBackup master server
- *Reviewer: Updated 1/14/13*
An Exchange server must have permission to browse a backup or to redirect a restore to another server or to a DAG.
See ["Allowing an Exchange server to browse a backup or to redirect a restore to another server or DAG"](#) on page 83.

Configuration for Replication Director

Reviewer: Added 1/4/13

Note the following if you use Replication Director to manage your VMware snapshots and snapshot replication:

- Because Replication Director uses the primary copy it does not require an unassigned drive letter or NFS.
- Configure the NetBackup Client Service with a logon account that has access to the CIFS shares that are created on the NetApp disk array.
See [“Configuring NetBackup with access to the CIFS share on the NetApp disk array”](#) on page 207.

Exchange granular operations and the NetBackup media server

Reviewer: New topic

Certain requirements exist for the media server when you perform operations with Granular Recovery Technology (GRT).

The media server requires configuration of the following:

- Network File System (NFS)
Reviewer: Phrasing Okay?
Note that Replication Director does not require NFS because it uses the primary copy.
- The client(s) or the media server must have the same version of Windows as the client from which the backup is made.
- If you use an Exchange granular proxy server, the database hosts and the proxy host must also meet the following additional requirements:
 - The proxy host name is included in the Distributed Application Restore Mapping in the Exchange client host properties
 - Have the same NetBackup version
 - Use the same NetBackup master server

About configuring the account for NetBackup Exchange operations

Reviewer: Updated 10/25/12

NetBackup must have access to Exchange mailboxes and public folders so it can do the following:

- Enumerate mailboxes when defining a policy.
- Restore mailbox and public folder objects from full database backups with **Enable granular recovery** selected.

NetBackup gains access to Exchange through the account for NetBackup Exchange operations, a unique Exchange mailbox that has permissions to perform backups and restores. This account is then configured as the account for the **Exchange credentials** in the Exchange client host properties. The account also needs the right to “Replace a process level token.”

Table 4-1 Steps to configure the account for NetBackup Exchange operations

Step	Action	Description
Step 1	Perform the following steps on the applicable Exchange granular clients and on the CAS server.	<p>In a cluster or replicated environment, perform the steps on each database node in the cluster. For Exchange 2010, perform the steps on each database node in the DAG and the CAS server.</p> <p>To determine which clients to configure for GRT operations, refer to the following topics:</p> <p>See “Exchange granular clients and non-VMware backups” on page 43.</p> <p>See “Exchange granular clients and VMware backups” on page 44.</p>

Table 4-1 Steps to configure the account for NetBackup Exchange operations
(continued)

Step	Action	Description
Step 2	On the applicable Exchange granular clients, create an Exchange mailbox for NetBackup (or account for NetBackup Exchange operations).	<p>Configure the account as follows:</p> <ul style="list-style-type: none"> ■ Symantec recommends that you create a uniquely named mailbox. Verify that this mailbox is not hidden. ■ <i>Reviewer: Since Exchange 2010 can have a "minimal" account, is it still accurate to say "domain privileged rights"?</i> <i>Writer: Add minimal account bullet and link</i> Ensure that the account has domain privileged rights. ■ <i>Reviewer: Added 1/30/13</i> Configure the account with the right to "Replace a process level token." ■ See the specific procedure for the Exchange version you have. See "Creating a privileged NetBackup user account for EWS access (Exchange 2010)" on page 50. See "Creating a minimal NetBackup account for Exchange operations (Exchange 2010)" on page 51. See "Configuring the account for NetBackup Exchange operations (Exchange 2007)" on page 52. See "Configuring the account for NetBackup Exchange operations (Exchange 2003)" on page 54.

Table 4-1

Steps to configure the account for NetBackup Exchange operations
(continued)

Step	Action	Description
Step 3	<p><i>Reviewer: Replaced steps for NetBackup Client and Legacy services with this step for the Exchange credentials.</i></p> <p>On the applicable Exchange granular clients, configure the Exchange credentials with the account you created in the previous step.</p>	<p>Note: If you upgraded from a previous version of NetBackup, only provide the credentials for the account for NetBackup Exchange operations in one location. Do not include the credentials in both the Exchange client host properties and as the logon account for the NetBackup Client Service and the NetBackup Legacy Network Service.</p> <p>If you use Replication Director, provide the credentials for the account that has access to the NetApp disk array. In the Exchange client host properties, include the credentials for account for NetBackup Exchange operations.</p> <p>See “About the Exchange credentials in the client host properties” on page 39.</p>
Step 4	Configure the account for NetBackup Exchange operations with the right to “Replace a process level token”.	See “ Configuring local security privileges for the account for NetBackup Exchange operations ” on page 55.

About NetBackup and Microsoft Exchange Web Services (Exchange 2010)

For Exchange 2010, NetBackup uses Microsoft Exchange Web Services (EWS) to support a backup that uses the Granular Recovery Technology (GRT). EWS provides support for the restore of individual mailboxes, mail messages, and public folders from an Exchange 2010 database backup.

To use EWS to restore individual items, the client throttling policy is disabled for the resource credentials you specify for the restore job. The client throttling policy is located on the Client Access Server and enforces connection bandwidth limits on the Exchange server.

NetBackup also creates an impersonation role and a role assignment for Exchange Impersonation. Exchange Impersonation role assignment associates the impersonation role with the NetBackup resource credentials you specify for the restore job. NetBackup creates and assigns the following roles:

- SymantecEWSImpersonationRole
- SymantecEWSImpersonationRoleAssignment

Creating a privileged NetBackup user account for EWS access (Exchange 2010)

This procedure provides an example of how to create a privileged account for NetBackup Exchange operations for EWS access with Exchange 2010. This account is used for the **Exchange credentials** in the Exchange client host properties, enabling NetBackup to perform operations with Granular Recovery Technology (GRT).

Note the following:

- Configure each Exchange mailbox server and the CAS server.
- Configure each client that performs granular operations. To determine which clients to configure, see the following topic:
See [“Exchange granular clients and non-VMware backups”](#) on page 43.
See [“Exchange granular clients and VMware backups”](#) on page 44.
- In a cluster environment, perform the steps on each database node in the cluster. For an Exchange DAG, perform the steps on each database node in the DAG and the CAS server.
- In previous versions of NetBackup, to perform operations with Granular Recovery Technology (GRT) you configured the NetBackup Client Service and the NetBackup Legacy Network Service with a different logon account. Customers upgrading from earlier versions of NetBackup can continue to use that configuration.

To create a privileged NetBackup user account for EWS access (Exchange 2010)

- 1 In Active Directory Users and Computers, select the **Users** directory.
- 2 Right-click and select **New > User** and indicate a name for your new account.
- 3 Double-click on the account you created.
- 4 Select the **Member Of** tab.
- 5 Click **Add** and add these objects to the user:
 - **Domain Users**
 - **Organization Management**If permissions issues persist, try adding the Domain Admins group to this account.
- 6 *Reviewer: Updated 1/17/12*
Provide the credentials for this account in the Exchange client host properties.
See [“About the Exchange credentials in the client host properties”](#) on page 39.

Creating a minimal NetBackup account for Exchange operations (Exchange 2010)

Reviewer: New procedure 11/1/12

This procedure describes how to create a minimal account for NetBackup Exchange operations for Exchange 2010. This account is used for the **Exchange credentials** in the Exchange client host properties, enabling NetBackup to perform operations with Granular Recovery Technology (GRT).

Note the following:

- Configure each Exchange mailbox server and the CAS server.
- Configure each client that performs granular operations. To determine which clients to configure, see the following topic:
See [“Exchange granular clients and non-VMware backups”](#) on page 43.
See [“Exchange granular clients and VMware backups”](#) on page 44.
- In a cluster environment, perform the steps on each database node in the cluster. For an Exchange DAG, perform the steps on each database node in the DAG and the CAS server.
- In previous versions of NetBackup, to perform operations with Granular Recovery Technology (GRT) you configured the NetBackup Client Service and the NetBackup Legacy Network Service with a different logon account. Customers upgrading from earlier versions of NetBackup can continue to use that configuration.

To create a minimal NetBackup account for Exchange 2010 operations

- 1 In Active Directory Users and Computers, select the **Users** directory.
- 2 Right-click and select **New > User** and indicate a name for your new account. For example, *NetBackup Account*.
- 3 Select the **Member Of** tab.
- 4 Use the Exchange Management Shell to perform the following:
 - Create a new Role Group and make the account a member this group:

```
New-RoleGroup -Name groupName -Members NetBackup Account
```

- Assign the following roles to the Role Group:
 - Database Copies
 - Databases
 - Exchange Servers
 - Monitoring
 - Mail Recipient Creation

Mail Recipients
Recipient Policies

- 5 *Reviewer: local admin rights mentioned here*
Add the account you created to the local administrators group.
- 6 To perform restores with Granular Recovery Technology (GRT), also perform the following tasks with the Exchange Management shell:

Note: If the account does not have the necessary privileges, an administrator needs to perform these tasks.

- Add **SymantecEWSImpersonationRoleAssignment** to the account you created in 2

```
New-ManagementRole -Name SymantecEWSImpersonationRole -Parent ApplicationImpersonation
```

```
New-ManagementRoleAssignment -Role SymantecEWSImpersonationRole -User NetBackup Account  
SymantecEWSImpersonationRoleAssignment
```

Where *NetBackup Account* is the alias of the Active Directory account you created in 2.

- Create a Throttling Policy named **SymantecEWSRestoreThrottlingPolicy**.
Reviewer: Do you add the NetBackup account somehow to this policy?

```
New-ThrottlingPolicy -Name SymantecEWSRestoreThrottlingPolicy
```

- 7 *Reviewer: Updated 1/17/12*
Provide the credentials for this account in the Exchange client host properties.
See “[About the Exchange credentials in the client host properties](#)” on page 39.

Configuring the account for NetBackup Exchange operations (Exchange 2007)

This procedure describes how to create a privileged account for NetBackup Exchange operations with for Exchange 2007.

Reviewer: Added 11/19/12

This account is used for the **Exchange credentials** in the Exchange client host properties, enabling NetBackup to perform operations with Granular Recovery Technology (GRT).

Note the following:

- Configure each client that performs granular operations. To determine which clients to configure, see the following topic:
See “[Exchange granular clients and non-VMware backups](#)” on page 43.
See “[Exchange granular clients and VMware backups](#)” on page 44.
- In a cluster or replicated environment, perform the steps on each Exchange node.
- *Reviewer: Added 11/19/12*
In previous versions of NetBackup, to perform operations with Granular Recovery Technology (GRT) you configured the NetBackup Client Service with a different logon account. Customers upgrading from earlier versions of NetBackup can continue to use that configuration.

To configure the account for NetBackup Exchange operations (Exchange 2007)

- 1 In Active Directory Users and Computers, select the **Users** directory.
- 2 Right-click on the Administrator account, click **Copy**, and create an account for NetBackup.

Create a user account that has a mailbox with a unique name. A unique name is one that does not already exist within the Exchange Organization. This name cannot be contained as a set of characters in an existing name.

For example: EXCH1 is entered as the unique mailbox name, and other mailbox names such as EXCH1BACKUP or BACKUPEXCH1 exist. The backup or restore of individual mailboxes or both fail.
- 3 After you create the account, double-click the account, click the **Members Of** tab, and add this account to the Domain Admins group.
- 4 Open the Exchange Management Console.
- 5 In the Exchange Management Console, right-click on **Organization Configuration** and click **Add Exchange Administrator**.
- 6 On the **Add Exchange Administrator** page, click **Browse** and select the user to which you want to delegate control.
- 7 Click the **Exchange Server Administrator** role.
- 8 Under **Select the server(s) to which this role has access**, click **Add**.
- 9 Select the servers to which you want to delegate control and click **OK**.
- 10 Click **Add**.

- 11 On the **Completion** page, verify that the delegation was successful and click **Finish**.
- 12 Provide the credentials for this account in the Exchange client host properties.
See [“About the Exchange credentials in the client host properties”](#) on page 39.

Configuring the account for NetBackup Exchange operations (Exchange 2003)

This procedure describes how to create a privileged account for NetBackup Exchange operations for Exchange 2003.

Reviewer: Added 11/19/12

This account is used for the **Exchange credentials** in the Exchange client host properties, enabling NetBackup to perform operations with Granular Recovery Technology (GRT).

Note the following:

- Configure each client that performs granular operations. To determine which clients to configure, see the following topic:
See [“Exchange granular clients and non-VMware backups”](#) on page 43.
- In a cluster environment, perform the steps on each Exchange node in the cluster.
- *Reviewer: Added 11/19/12*
In previous versions of NetBackup, to perform operations with Granular Recovery Technology (GRT) you configured the NetBackup Client Service with a different logon account. Customers upgrading from earlier versions of NetBackup can continue to use that configuration.

To configure the account for NetBackup Exchange operations (Exchange 2003)

- 1 Use Active Directory Users and Computers to create a user account that has a mailbox with a unique name.

A unique name is one that does not already exist within the Exchange Organization. This name cannot be contained as a set of characters in an existing name.

For example: EXCH1 is entered as the unique mailbox name, and other mailbox names such as EXCH1BACKUP or BACKUPEXCH1 exist. The backup or restore of individual mailboxes or both fail.

- 2 After you create the account, double-click the account, click the **Members Of** tab, and add this account to the Domain Admins group.
- 3 Open Exchange System Manager.

- 4 Right-click the Exchange Organization and click **Delegate Control**.
- 5 Click **Next**.
- 6 On the Users or the Groups screen, click **Add**.
- 7 In the **Delegate Control** dialog box, provide the following information.

Group or User	Specify the name of the account that was created in step 1.
Role	Select Exchange Full Administrator.

- 8 Complete the Delegation wizard.
- 9 Provide the credentials for this account in the Exchange client host properties.
See [“About the Exchange credentials in the client host properties”](#) on page 39.

Configuring local security privileges for the account for NetBackup Exchange operations

Reviewer: New topic. I copied the first paragraph from the SharePoint manual, don't know if it is even accurate for Exchange. 12/4/12

Reviewer: Is it necessary to add this right for all Exchange GRT configurations or only for RD? 12/4/12

On each Exchange mailbox servers you must assign the account for NetBackup Exchange operations the right to “Replace a process level token”. This right is necessary since the NetBackup for Exchange Agent logs on as the Exchange user when it accesses data.

Configuring local security privileges for the account for NetBackup Exchange operations (Local Security Policy)

To configure local security privileges for the account for NetBackup Exchange operations (Local Security Policy)

- 1 Open the **Local Security Policy**.
- 2 Click **Local Policies**.
- 3 In the User Rights Assignment, add the account for NetBackup Exchange operations to the **Replace a process level token** property.
- 4 Run the group policy update command (group policy update) for this change to take effect:

```
gpupdate /Force
```

Configuring local security privileges for the account for NetBackup Exchange operations (on a domain controller)

To configure local security privileges for the account for NetBackup Exchange operations (on a domain controller)

- 1 *Reviewer: New procedure per ET2685336. 1/7/12*
Open the **Group Policy Management**.
- 2 Under the domain, select **Group Policy Objects > Default Domain Controllers Policy**.
- 3 Click the **Settings** tab.
- 4 Expand **Security Settings > Local Policies**.
- 5 Right-click on **User Rights Assignment** and click **Edit**.
- 6 In the Group Policy Object Editor, expand **Computer Configuration > Policies > Windows Settings > Security Settings > Local Policies**.
- 7 In the User Rights Assignment, add the account for NetBackup Exchange operations to the **Replace a process level token** property.
- 8 Run the group policy update command (group policy update) for this change to take effect:

```
gpupdate /Force
```

Configuring an Exchange backup that uses Granular Recovery Technology (GRT) (non-VMware backups)

Note: These steps are applicable for a non-VMware backup. To use GRT with a VMware backup, refer to the following topic:

See [“Configuring Granular Recovery Technology \(GRT\) with a VMware backup that protects Exchange”](#) on page 200.

Reviewer: Changed "Exchange granular clients" to "all Exchange mailbox servers and CAS server".

Configuring an Exchange backup that uses Granular Recovery Technology (GRT) (non-VMware backups)**Table 4-2**

Configuring an Exchange backup that uses Granular Recovery Technology (GRT) with a non-VMware backup

Step	Action	Description
Step 1	Verify that you have a supported Exchange Server configuration and have a media server platform that supports GRT.	See the <i>NetBackup Database Agent Compatibility List</i> . See the <i>NetBackup Operating System Compatibility List</i> .
Step 2	Ensure that requirements are met for the Exchange server software.	See “ Exchange server software requirements for NetBackup for Exchange ” on page 26.
Step 3	<i>Reviewer: Changed from "granular clients" to "all mailbox servers and the CAS Server" 2/1/13</i> All mailbox servers and the CAS Server must meet certain requirements, including the following: <ul style="list-style-type: none"> ■ On each server, have an unassigned drive letter ■ Have Network File System (NFS) configured or enabled ■ The Exchange credentials are configured in the Exchange client host properties 	To determine which clients to configure, refer to the following topic: See “ Exchange granular clients and non-VMware backups ” on page 43. In a cluster or replicated environment, perform the steps on each database node in the cluster. For an Exchange 2010 DAG, perform the steps on each database node in the DAG and the CAS server.
Step 4	On all Exchange mailbox servers and the CAS Server, ensure that each node has an unassigned drive letter on which to mount the backup image.	
Step 5	On all Exchange mailbox servers and the CAS Server, enable or configure NFS for your environment.	See “ Enabling Services for Network File System (NFS) on Windows 2012 ” on page 61. See “ About configuring Services for Network File System (NFS) on Windows 2008 and Windows 2008 R2 ” on page 65. See “ About configuring Services for Network File System (NFS) on Windows 2003 R2 SP2 ” on page 73. See “ Configuring a UNIX media server and Windows clients for backups and restores that use Granular Recovery Technology (GRT) ” on page 78.

Table 4-2 Configuring an Exchange backup that uses Granular Recovery Technology (GRT) with a non-VMware backup (*continued*)

Step	Action	Description
Step 6	Configure NFS on the media server.	<p>See “Enabling Services for Network File System (NFS) on Windows 2012” on page 61.</p> <p>See “About configuring Services for Network File System (NFS) on Windows 2008 and Windows 2008 R2” on page 65.</p> <p>See “About configuring Services for Network File System (NFS) on Windows 2003 R2 SP2” on page 73.</p> <p>See “Configuring a UNIX media server and Windows clients for backups and restores that use Granular Recovery Technology (GRT)” on page 78.</p>
Step 7	<p><i>Reviewer: Since Exchange 2010 can have a "minimal" mailbox or account, is it still accurate to say "domain privileged rights"?</i></p> <p>On each mailbox server, create an account for Exchange operations (a unique mailbox) for NetBackup that has domain privileged rights.</p>	See “ About configuring the account for NetBackup Exchange operations ” on page 46.
Step 8	On the applicable Exchange mailbox servers and the CAS server, add the credentials for the account for NetBackup Exchange operations to the Exchange credentials. This property is located in the Exchange client host properties.	See “ About the Exchange credentials in the client host properties ” on page 39.
Step 9	<p>Create a MS-Exchange-Server policy as follows:</p> <ul style="list-style-type: none"> ■ Select a supported disk storage unit. ■ Select Enable granular recovery on the Attributes tab. 	<p>See <i>Disk Storage Types supported for Granular Recovery Technology (GRT)</i> at the following URL: http://www.symantec.com/docs/TECH187917</p> <p>For more information on how to create a policy with GRT, see the following:</p> <p>See “About configuring snapshot backups of Exchange Server” on page 110.</p> <p>See “Configuring streaming backups of Exchange Server (Exchange 2007)” on page 133.</p>

Table 4-2Configuring an Exchange backup that uses Granular Recovery Technology (GRT) with a non-VMware backup (*continued*)

Step	Action	Description
Step 10	(Conditional) Configure the privileges for granular operations.	If you want to perform user-directed granular browse and restore operations, configure the privileges for granular operations. Otherwise, you need to perform granular operations from the server. See “Allowing an Exchange server to browse a backup or to redirect a restore to another server or DAG” on page 83.
Step 11	On the NetBackup master server, configure the list of Exchange hosts.	For backups in a DAG, cluster, private network, or if you use a proxy host or off-host client, you must create a mapping of host names. For example, each DAG node and the CAS server must be able to access a backup image using the DAG name. Configure this mapping in the Distributed Application Restore Mapping host property on the master server. See “Configuring the Exchange hosts for a backup that uses Granular Recovery Technology (GRT)” on page 79.

About installing and configuring Network File System (NFS) for Exchange Granular Recovery

Writer: Need to update this to reflect VMware backups (media server does not require NFS)? Need to update this text to reflect NFS is not needed with RD (except when restoring tar images).

NetBackup Granular Recovery leverages Network File System, or NFS, to read individual objects from a database backup image. Specifically, the NetBackup client uses NFS to extract data from the backup image on the NetBackup media server. The NetBackup client uses “Client for NFS” to mount and access a mapped drive that is connected to the NetBackup media server. The NetBackup media server handles the I/O requests from the client through NBFSD.

NBFSD is the NetBackup File System (NBFS) service that runs on the media server. NBFSD makes a NetBackup backup image appear as a file system folder to the NetBackup client over a secure connection.

Network File System, or NFS, is a widely recognized, open standard for client and server file access over a network. It allows clients to access files on dissimilar servers through a shared TCP/IP network. NFS is typically bundled with the host

operating system. NetBackup uses Granular Recovery Technology (GRT) and NFS to recover the individual objects that reside within a database backup image, such as:

- A user account from an Active Directory database backup
- Email messages or folders from an Exchange database backup
- A document from a SharePoint database backup

Multiple NetBackup agents that support GRT (for example, Exchange, SharePoint, and Active Directory) can use the same media server.

About configuring Services for Network File System (NFS) on Windows 2012

To restore individual items from a database backup, you must configure Services for Network File System (NFS) on the NetBackup media server, the Exchange granular clients, and the CAS server.

Table 4-3 Configuring NFS on Windows 2012

Step	Action	Description
Step 1	Configure NFS on the media server.	<p><i>Reviewer: New 10/19/12</i></p> <p>Before you configure NFS, review the requirements for the media server. See “Exchange granular operations and the NetBackup media server” on page 46.</p> <p>On the media server do the following:</p> <ul style="list-style-type: none"> ■ Stop and disable the ONC/RPC Portmapper service, if it exists. ■ Enable NFS. See “Enabling Services for Network File System (NFS) on Windows 2012” on page 61. ■ Stop the Server for NFS service. See “Disabling the Server for NFS” on page 69. ■ Stop the Client for NFS service. See “Disabling the Client for NFS on the media server” on page 71. Note: If an Exchange granular client resides on the media server, do not disable the Client for NFS. ■ Configure the portmap service to start automatically at server restart. Issue the following from the command prompt: <code>sc config portmap start= auto</code> This command should return the status [SC] ChangeServiceConfig SUCCESS.

Table 4-3 Configuring NFS on Windows 2012 (*continued*)

Step	Action	Description
Step 2	Configure NFS on the Exchange granular clients and the CAS server.	<p>Determine which clients to configure.</p> <p>See “Exchange granular clients and non-VMware backups” on page 43.</p> <p>See “Exchange granular clients and VMware backups” on page 44.</p> <p>On the Exchange granular clients and the CAS server, do the following:</p> <ul style="list-style-type: none"> ■ Enable NFS on the clients. See “Enabling Services for Network File System (NFS) on Windows 2012” on page 61. ■ Stop the Server for NFS service. See “Disabling the Server for NFS” on page 69.

Enabling Services for Network File System (NFS) on Windows 2012

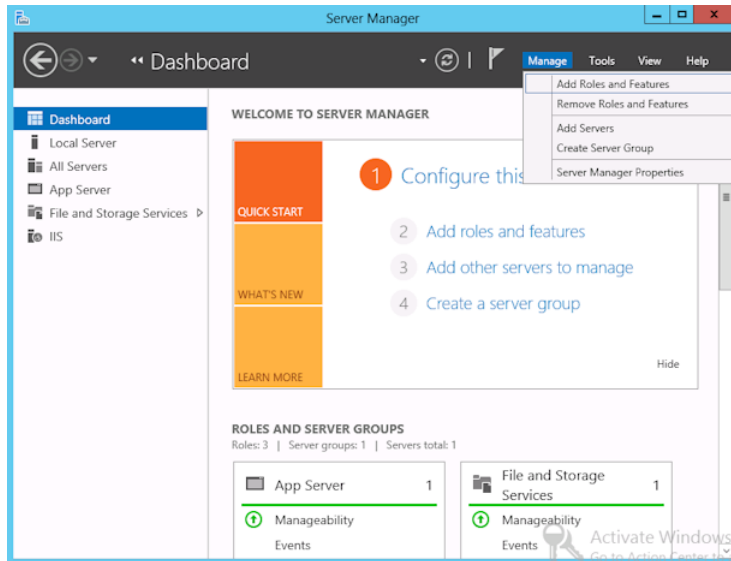

To restore individual items from a backup that uses Granular Recovery Technology (GRT), you must enable Services for Network File System (NFS). When this configuration is completed on the media server and the Exchange granular clients, you can disable any unnecessary NFS services. More information is available on which clients require this configuration.

See [“Exchange granular clients and non-VMware backups”](#) on page 43.

See [“Exchange granular clients and VMware backups”](#) on page 44.

To enable Services for Network File System (NFS) on Windows 2012

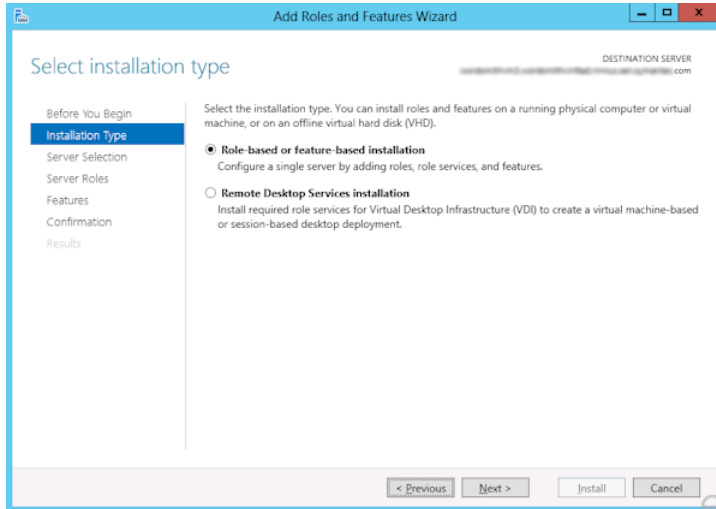

- 1 Open the Server Manager.
- 2 From the **Manage** menu, click **Add Roles and Features**.

- 3 In the Add Roles and Features Wizard, on the **Before You Begin** page, click **Next**.

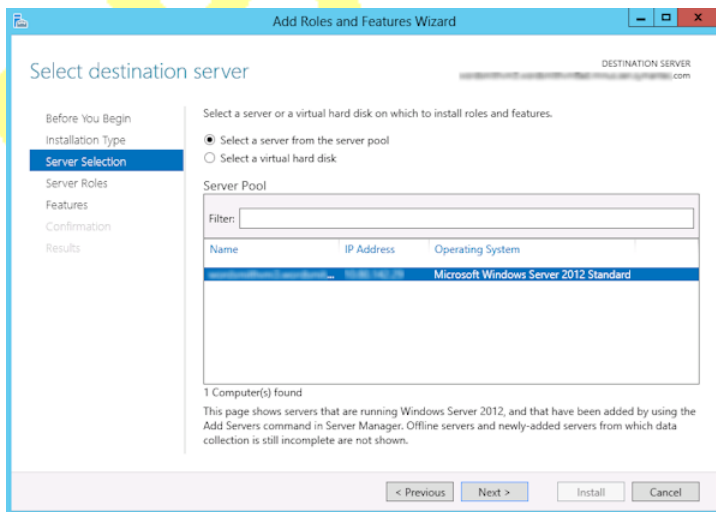

About installing and configuring Network File System (NFS) for Exchange Granular Recovery

- 4 On the **Select installation type** page, select **Role-based or feature-based installation**.

- 5 Click **Next**.

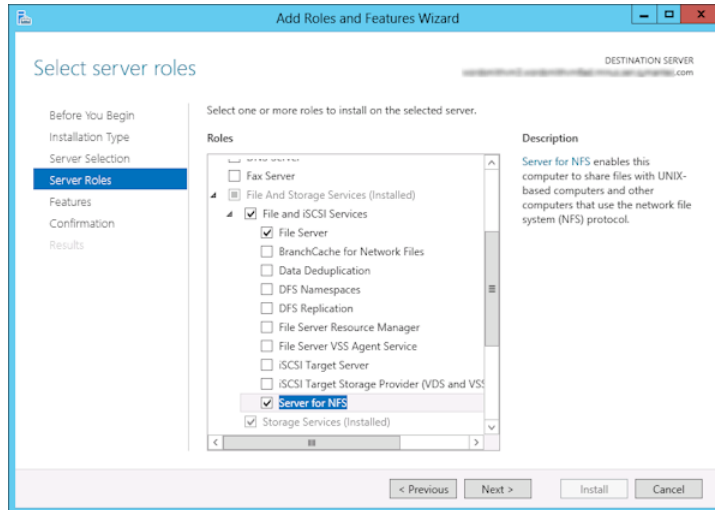

- 6 On the **Server Selection** page, click **Select a server from the server pool** and select the server. Click **Next**.

Reviewer: Changed title to reflect support for GRT 1/7/13

About installing and configuring Network File System (NFS) for Exchange Granular Recovery

- 7 On the **Server Roles** page, expand **File and Storage Services** and **File and iSCSI Services**.
- 8 Click **File Server** and **Server for NFS**. When prompted, click **Add Features**. Click **Next**.

- 9 *Reviewer: Should the user restart the destination server automatically if req'd? 10/24/12*

On the **Confirmation** page, click **Install**.

- 10 *Writer: Update this step appropriately. If the user only installs Client for NFS, only need to say it can be disabled on media server.*

For each host in your configuration, choose from one of the following:

- If you have a single host that functions as both the media server and the Exchange granular client, you can disable the Server for NFS.
See [“Disabling the Server for NFS”](#) on page 69.
- For a host that is only the NetBackup media server, you can disable the Server for NFS and the Client for NFS.
See [“Disabling the Server for NFS”](#) on page 69.
See [“Disabling the Client for NFS on the media server”](#) on page 71.
- For a host that is only an Exchange granular client, you can disable the Server for NFS.
See [“Disabling the Server for NFS”](#) on page 69.

About configuring Services for Network File System (NFS) on Windows 2008 and Windows 2008 R2

To restore individual items from a database backup, you must configure Services for Network File System (NFS) on the NetBackup media server, the Exchange granular clients, and the CAS server.

Table 4-4 Configuring NFS in a Windows 2008 or Windows 2008 R2 environment

Step	Action	Description
Step 1	Configure NFS on the media server.	<p>Before you configure NFS, review the requirements for the media server. See “Exchange granular operations and the NetBackup media server” on page 46.</p> <p>On the media server do the following:</p> <ul style="list-style-type: none"> ■ Stop and disable the ONC/RPC Portmapper service, if it exists. ■ Enable NFS. See “Enabling Services for Network File System (NFS) on Windows 2008 or Windows 2008 R2” on page 66. ■ Stop the Server for NFS service. See “Disabling the Server for NFS” on page 69. ■ Stop the Client for NFS service. See “Disabling the Client for NFS on the media server” on page 71. Note: If an Exchange granular client resides on the media server, do not disable the Client for NFS. ■ Configure the portmap service to start automatically at server restart. Issue the following from the command prompt: <code>sc config portmap start= auto</code> This command should return the status [SC] ChangeServiceConfig SUCCESS.
Step 2	Configure NFS on the Exchange granular clients and the CAS server.	<p>Determine which clients to configure. See “Exchange granular clients and non-VMware backups” on page 43. See “Exchange granular clients and VMware backups” on page 44.</p> <p>On the Exchange granular clients and the CAS server, do the following:</p> <ul style="list-style-type: none"> ■ Enable NFS. See “Enabling Services for Network File System (NFS) on Windows 2008 or Windows 2008 R2” on page 66. ■ Stop the Server for NFS service. See “Disabling the Server for NFS” on page 69.

Table 4-4 Configuring NFS in a Windows 2008 or Windows 2008 R2 environment (*continued*)

Step	Action	Description
Step 3	Install the hotfix for Client for NFS on the Exchange granular clients and the CAS server.	<p>On the Exchange granular clients and the CAS server, install the hotfix for Client for NFS. The hotfix is available at the following location: http://support.microsoft.com/kb/955012</p> <p>Note: Important Windows Vista hotfixes and Windows Server 2008 hotfixes are included in the same packages. However, the hotfix Request page lists only Windows Vista. To request the hotfix package that applies to one or both operating systems, select the hotfix that is listed under Windows Vista on the page. Always refer to the Applies To section in articles to determine the actual operating system for each hotfix.</p>

Enabling Services for Network File System (NFS) on Windows 2008 or Windows 2008 R2

To restore individual items from a backup that uses Granular Recovery Technology (GRT), you must enable Services for Network File System (NFS). When this configuration is completed on the media server and the Exchange granular clients, you can disable any unnecessary NFS services. More information is available on which clients require this configuration.

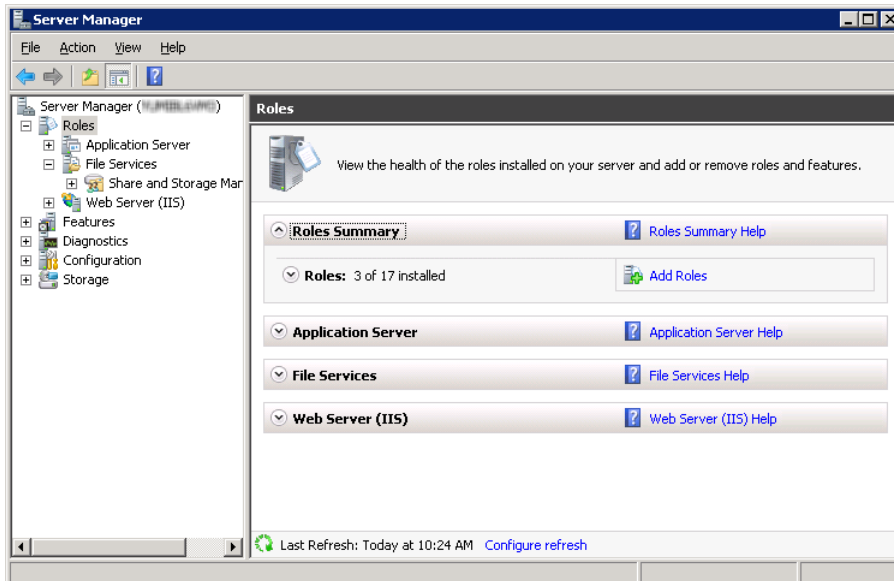

See “Exchange granular clients and non-VMware backups ” on page 43.

See “Exchange granular clients and VMware backups” on page 44.

About installing and configuring Network File System (NFS) for Exchange Granular Recovery

To enable Services for Network File System (NFS) on Windows 2008 or Windows 2008 R2

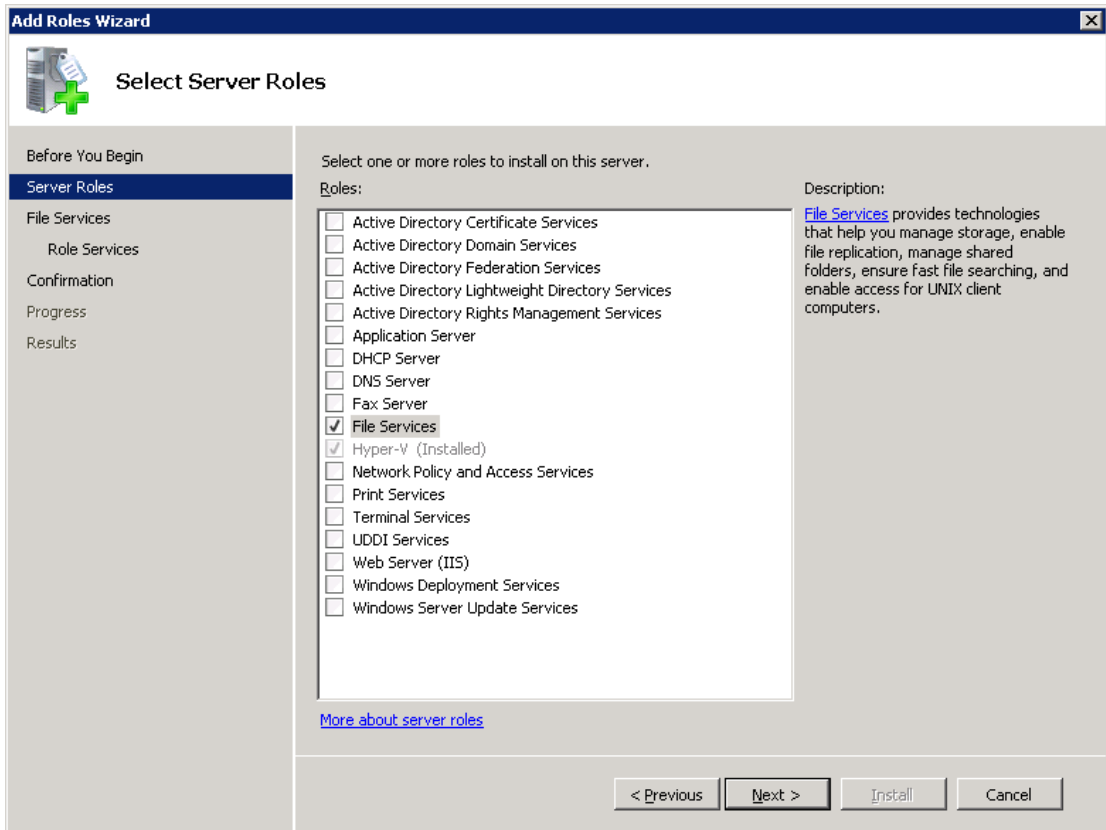

- 1 Open the Server Manager.
- 2 In the left pane, click **Roles** and, in the right pane, click **Add Roles**.

- 3 In the Add Roles Wizard, on the **Before You Begin** page, click **Next**.

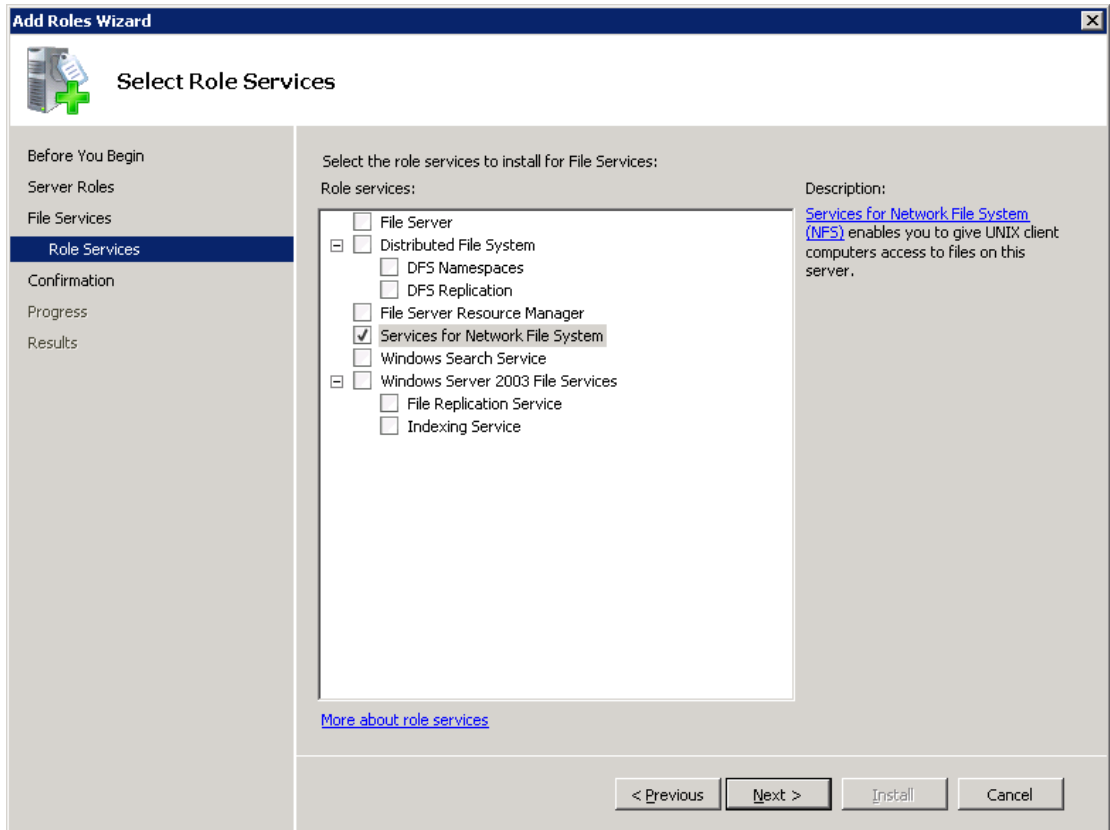

- 4 On the **Select Server Roles** page, under **Roles**, check the **File Services** check box. Click **Next**.

Note: If a role service is already installed for the File Services role, you can add other role services from Roles home page. In the File Services pane, click **Add Role Services**.

- 5 On the **Files Services** page, click **Next**.
- 6 On the **Select Role Services** page, do the following:
 - Uncheck **File Server**.
 - Check **Services for Network File System**.
 - Click **Next** and complete the wizard.

About installing and configuring Network File System (NFS) for Exchange Granular Recovery

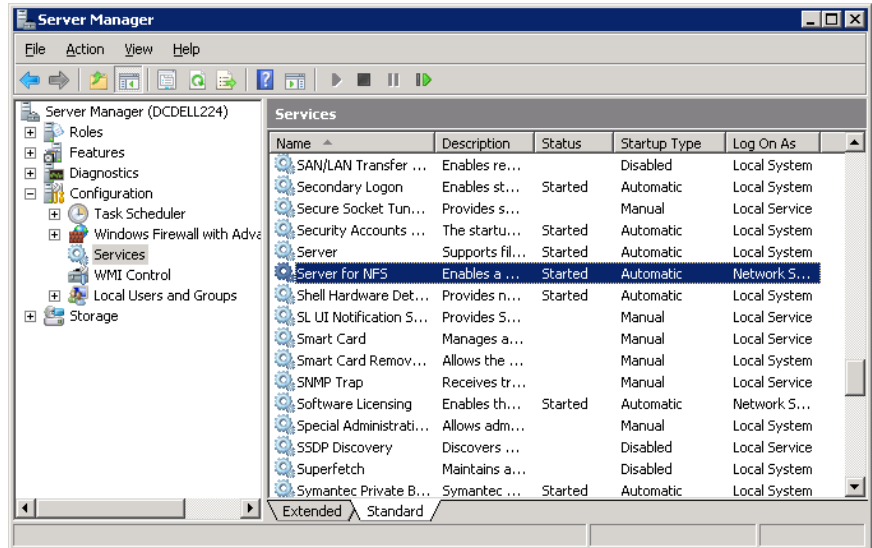

- 7 For each host in your configuration, choose from one of the following:
- If you have a single host that functions as both the media server and the Exchange granular client, you can disable the Server for NFS.
 - For a host that is only the NetBackup media server, you can disable the Server for NFS and the Client for NFS.
 - For a host that is only an Exchange granular client, you can disable the Server for NFS.

Disabling the Server for NFS

After you enable Services for Network File System (NFS) on the media server and on the Exchange granular clients, you can disable Server for NFS.

To disable the Server for NFS

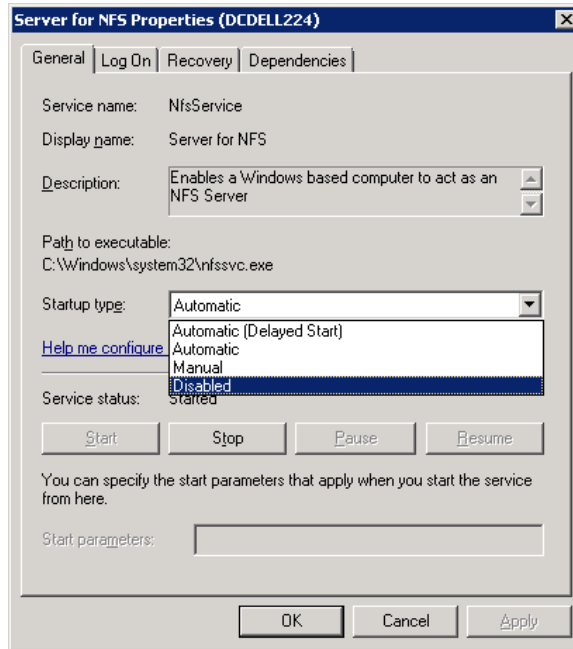

- 1 Open the Server Manager.
- 2 In the left pane, expand **Configuration**.
- 3 Click **Services**.

- 4 In the right pane, right-click on **Server for NFS** and click **Stop**.
- 5 In the right pane, right-click on **Server for NFS** and click **Properties**.

About installing and configuring Network File System (NFS) for Exchange Granular Recovery

- 6 In the **Server for NFS Properties** dialog box, from the **Startup type** list, click **Disabled**.

- 7 Click **OK**.
- 8 Repeat this procedure for the media server and for each Exchange granular client.

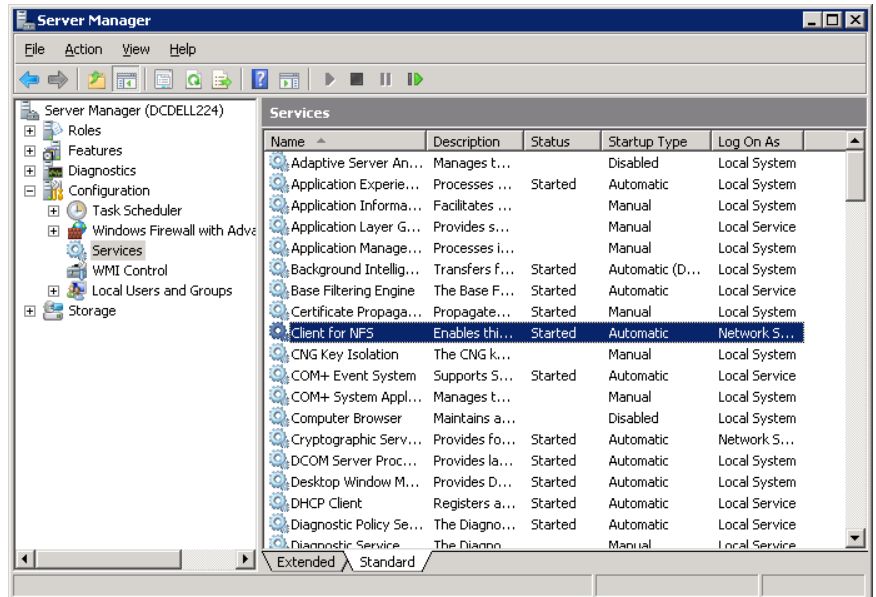

Disabling the Client for NFS on the media server

After you enable Services for Network File System (NFS) on a host that is only a NetBackup media server, you can disable the Client for NFS.

To disable the Client for NFS on the NetBackup media server

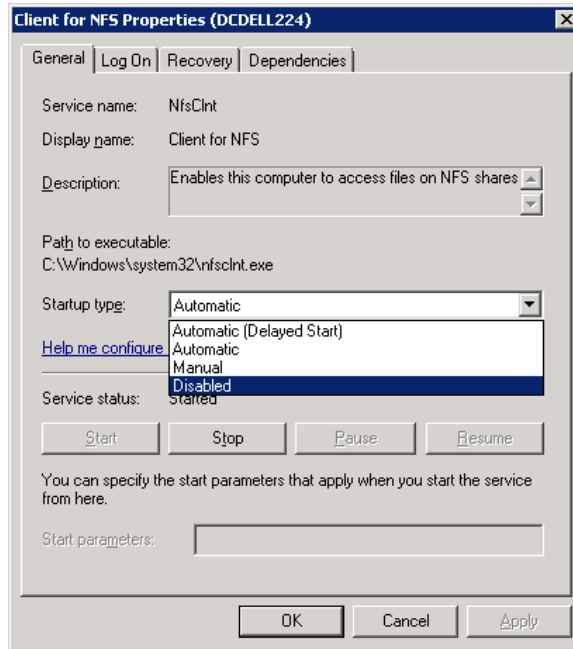

- 1 Open the Server Manager.
- 2 In the left pane, expand **Configuration**.

3 Click **Services**.

- 4 In the right pane, right-click on **Client for NFS** and click **Stop**.
- 5 In the right pane, right-click on **Client for NFS** and click **Properties**.

- 6 In the **Client for NFS Properties** dialog box, from the **Startup type** list, click **Disabled**.

- 7 Click **OK**.

About configuring Services for Network File System (NFS) on Windows 2003 R2 SP2

Note: NetBackup does not support Granular Recovery Technology (GRT) with Windows Server 2003 R1 or earlier versions.

To restore individual items from a database backup, you must configure Services for Network File System (NFS) on the NetBackup media server and the Exchange granular clients.

Table 4-5

Step	Action	Description
Step 1	Install the necessary NFS components on the NetBackup media server.	<p>On the media server do the following:</p> <ul style="list-style-type: none"> ■ Stop and disable the ONC/RPC Portmapper service, if it exists. ■ Install the following NFS components: <ul style="list-style-type: none"> ■ RPC External Data Representation ■ RPC Port Mapper ■ If an Exchange granular client resides on the media server, also install the following components: <ul style="list-style-type: none"> ■ Client for NFS ■ Microsoft Services for NFS Administration ■ Configure the portmap service to start automatically at server restart. <p>Issue the following from the command prompt:</p> <pre>sc config portmap start= auto</pre> <p>This command should return the status [SC] ChangeServiceConfig SUCCESS.</p> <p>See Table 4-6 on page 75.</p> <p>See “Installing Services for NFS on the Windows 2003 R2 SP2 media server” on page 75.</p>
Step 2	Configure the Client for NFS service on the media server.	<p>Depending on configuration of the host, verify that Client for NFS is configured correctly:</p> <ul style="list-style-type: none"> ■ For a single host that has both the media server and the Exchange granular client, ensure Client for NFS is running. ■ For a host that is only a NetBackup media server, Client for NFS can be stopped and disabled.

Table 4-5 (continued)

Step	Action	Description
Step 3	Install the necessary NFS components on the Exchange granular clients.	<p>Determine which clients to configure.</p> <p>See “Exchange granular clients and non-VMware backups” on page 43.</p> <p>See “Exchange granular clients and VMware backups” on page 44.</p> <p>On the client do the following:</p> <ul style="list-style-type: none"> ■ Install the following NFS components: <ul style="list-style-type: none"> ■ The RPC External Data Representation ■ RPC Port Mapper ■ Client for NFS ■ Microsoft Services for NFS Administration ■ After the installation completes, ensure that the Client for NFS service is running. <p>See Table 4-6 on page 75.</p> <p>See “Installing Services for NFS on Exchange granular clients with Windows 2003 R2 SP2” on page 77.</p>
Step 4	Install the hotfixes for Client for NFS on the Exchange granular clients.	<p>The hotfixes are available at the following location:</p> <p>http://support.microsoft.com/kb/947186</p> <p>http://support.microsoft.com/kb/955012</p>

Table 4-6 NFS components required for Windows 2003 R2 SP2

NFS component	NetBackup client	NetBackup media server
Client for NFS	X	
Microsoft Services for NFS Administration	X	
RPC External Data Representation	X	X
RPC Port Mapper		X

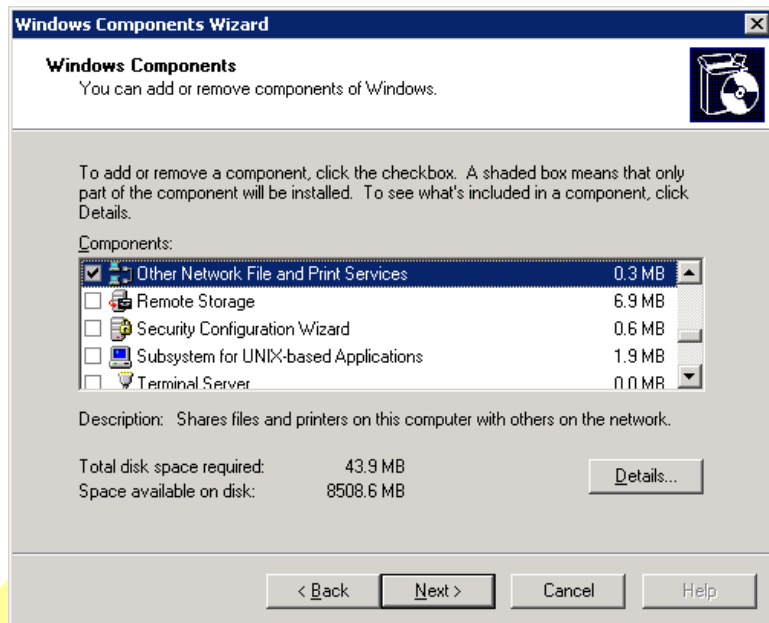

Installing Services for NFS on the Windows 2003 R2 SP2 media server

To restore individual items from a backup that uses Granular Recovery Technology (GRT), you must install Services for Network File System (NFS) on the NetBackup

media server. For VMware backups that protect Exchange, you do not need to install NFS on the media server.

To install Services for NFS on the Windows 2003 R2 SP2 media server

- 1 Click **Start > Control Panel > Add or Remove Programs**.
- 2 Click **Add/Remove Windows Components**.
- 3 Check **Other Network File and Print Services** and click **Details**.

- 4 Check **Microsoft Service for NFS** and click **Details**.
- 5 Install the components that apply to your configuration.
 - If the host is only a NetBackup media server, check the following components:
 - RPC External Data Representation
 - RPC Port Mapper
 - If you have a single host that functions as both the media server and the Exchange granular client, check the following components:
 - Client for NFS
 - Microsoft Services for NFS Administration

- RPC External Data Representation
 - RPC Port Mapper
- 6 Click **OK**.
 - 7 Click **OK**.
 - 8 Click **Next** and complete the Windows Components Wizard.
 - 9 After the installation is complete, open Services in the Control Panel.
 - 10 Depending on configuration of the host, verify that Client for NFS is running or is stopped and disabled:
 - For a single host that has both the media server and the Exchange granular client, ensure Client for NFS is running.
 - For a host that is only a NetBackup media server, Client for NFS can be stopped and disabled.

Installing Services for NFS on Exchange granular clients with Windows 2003 R2 SP2

This topic describes how to install NFS on the NetBackup clients with Windows 2003 R2 SP2. Only the clients that perform granular operations require NFS. If an Exchange granular client is also a media server, you must follow a different procedure.

See [“Installing Services for NFS on the Windows 2003 R2 SP2 media server”](#) on page 75.

More information is available on which clients require NFS.

See [“Exchange granular clients and non-VMware backups”](#) on page 43.

To install Services for NFS on the NetBackup clients with Windows 2003 R2 SP2

- 1 Click **Start > Control Panel > Add or Remove Programs**.
- 2 Click **Add/Remove Windows Components**.
- 3 Check **Other Network File and Print Services** and click **Details**.
- 4 Check **Microsoft Service for NFS** and click **Details**.
- 5 Check the following components:
 - Client for NFS
 - Microsoft Services for NFS Administration
 - RPC External Data Representation
- 6 Click **OK**.

- 7 Click **OK**.
- 8 Click **Next** and complete the Windows Components Wizard.
- 9 After the installation is complete, open Services in the Control Panel.
- 10 Ensure the following that the Client for NFS service is running.
- 11 Repeat this procedure for each Exchange client that performs granular operations.

Configuring a UNIX media server and Windows clients for backups and restores that use Granular Recovery Technology (GRT)

To perform backups and restores that use Granular Recovery Technology (GRT), perform the following configuration if you use a UNIX media server and Windows clients:

- Confirm that your media server is installed on a platform that supports granular recovery.
See the *NetBackup X Operating System* compatibility list.
- No other configuration is required for the UNIX media server.
- Enable or install NFS on the Exchange granular clients.
See “[Enabling Services for Network File System \(NFS\) on Windows 2008 or Windows 2008 R2](#)” on page 66.
See “[Installing Services for NFS on Exchange granular clients with Windows 2003 R2 SP2](#)” on page 77.
- You can configure a different network port for NBFSD.
See “[Configuring a different network port for NBFSD](#)” on page 78.

Configuring a different network port for NBFSD

NBFSD runs on port 7394. If another service uses the standard NBFSD port in your organization, you can configure the service on another port. The following procedures describe how to configure a NetBackup server to use a network port other than the default.

To configure a different network port for NBFSD (Windows server)

- 1 Log on as administrator on the computer where NetBackup server is installed.
- 2 Open Regedit.
- 3 Open the following key.:

HKEY_LOCAL_MACHINE\SOFTWARE\VERITAS\NetBackup\CurrentVersion\Config

- 4 Create a new DWORD value named **FSE_PORT**.
- 5 Right-click on the new value and click **Modify**.
- 6 In the **Value data** box, provide a port number between 1 and 65535.
- 7 Click **OK**.

To configure a different network port for NBFSD (UNIX server)

- 1 Log on as root on the computer where NetBackup server is installed.
- 2 Open the `bp.conf` file.
- 3 Add the following entry, where XXXX is an integer and is a port number between 1 and 65535.

FSE_PORT = XXXX

Disk storage units supported with Exchange Granular Recovery Technology (GRT)

Reviewer: Updated 1/30/13 per Rob

Granular backups must be made to a supported disk device. During the backup operation, the mailbox name or top public folder is cataloged. When you duplicate (`-bc_only`) a backup, NetBackup catalogs the entire contents of the backup image and the duplication can be targeted to any media. When you perform a restore, the primary backup image must exist on a supported disk media. You may need to perform another duplicate operation to copy the backup to disk.

More information is available on the disk storage units that are supported with GRT.

See the *NetBackup Release Notes*.

<http://www.symantec.com/docs/TECH187917>

Configuring the Exchange hosts for a backup that uses Granular Recovery Technology (GRT)

Reviewer: In the 7.0 review, I was told that you only have to configure DARM for GRT operations. But I have no notes on WHY. Doesn't the user have to configure the hosts for any operation with virtual client names, off-host backups, or private networks? 7/19/12

Writer: Whatever text we put in this topic needs to appear in the Admin Console help. If this topic only applies to GRT, then move this topic to the EGR chapter.

Any operations that use Granular Recovery Technology (GRT) require that you provide a list of the Exchange virtual and the physical host names. Also include the CAS server (Exchange 2010), the off-host client, and the granular proxy host. You set the configuration parameters in the host properties for the master server.

Note the following:

- Provide the short name or the fully qualified domain name (FQDN) of the host. It is not necessary to provide both forms of the name.
- You do not need to add the proxy host to the list if it is not a NetBackup master or a media server.
- (VMWare policies) For a standalone server, the backup is cataloged under a different client name if you chose a **Primary VM identifier** other than **VM hostame**. In the list of hosts, you must add the NetBackup client name and the name that reflects the identifier that you chose on the **VMware** tab.

See the following for examples:

- See [the section called “Example entries for Exchange hosts for a non-VMware backup”](#) on page 80.
- See [the section called “Example entries for Exchange hosts for a VMware backup”](#) on page 81.

To configure the Exchange hosts for a backup that uses Granular Recovery Technology (GRT)

- 1 On the master server, open the NetBackup Administration Console.
- 2 Select **NetBackup Management > Host Properties > Master Servers**.
- 3 In the right pane, double-click on the master server.
- 4 Select **Distributed Application Restore Mapping**.
- 5 Click **Add**.
- 6 Provide the name of the application host and the name of the component host. See [Table 4-7](#) and [Table 4-8](#)

Example entries for Exchange hosts for a non-VMware backup

Reviewer: I added separate lines for granular proxy host for each scenario, DAG, cluster, standalone

Table 4-7 Example entries for Exchange hosts for a non-VMware backup

Environment	Application host	Component host
DAG	Virtual name of DAG	Physical name of <i>Node 1</i>

Disabling the cataloging for duplications of Exchange backups using Granular Recovery Technology (GRT)

Note: This option does not apply to duplicating a VMware backup that protects Exchange. You cannot use the Administration Console to duplicate that kind of backup. You must use the command-line option `bpduplicate`.

Reviewer: Because all duplication operations require extra time, removed specific reference of disk to tape and image duplicated to tape. 1/31/13

Duplication of a backup that uses Granular Recovery Technology (GRT) takes extra time. NetBackup requires this extra time to catalog the granular Exchange information. You can choose not to catalog the granular information so that the

duplication is performed more quickly. However, then users are not able to browse for individual items on the image that was duplicated if the disk copy expires.

During the duplication process, NetBackup writes log entries periodically to show the progress of the job.

To disable the cataloging of Exchange backups using Granular Recovery Technology

- 1 On the master server, open the NetBackup Administration Console.
- 2 In the left pane, expand **Host Properties**.
- 3 Click **Master Servers**.
- 4 In the right pane, right-click the master server click **Properties**.
- 5 Click **General Server**.
- 6 Uncheck **Enable message-level cataloging when duplicating Exchange images that use Granular Recovery Technology**.
- 7 Click **OK**.

Allowing an Exchange server to browse a backup or to redirect a restore to another server or DAG

Reviewer: Larry, is this title better?

Reviewer: The review had conflicting comments. Larry and Lowell said this config is not necessary. Rob said it is.

This configuration is required if you want to browse backups or perform restores and you have an environment where the source client is different than the client that NetBackup uses for backup processing. More information is available on when this configuration is necessary.

See [“Exchange granular clients and non-VMware backups”](#) on page 43.

This configuration is necessary for restores with the following configurations:

- An Exchange DAG
- A clustered Exchange server
- A Exchange granular proxy host
See [“Configuring the Exchange granular proxy host”](#) on page 37.
- Off-host backups
- Backups over a private network
- When you select a destination client other than the source client

Alternatively, you can perform a server-directed restore. Further instructions are available on how to allow redirected restores in the *NetBackup Administrator's Guide, Volume I*.

To configure Exchange client and server privileges

- 1 On the master server, create the `altnames` directory, as follows:
 - In a non-clustered environment, create the following directory:
`install_path\NetBackup\db\altnames`
 - In a clustered environment, create the following directory:
`shared_drive_install_path\NetBackup\db\altnames`
- 2 On the master server, create the `altnames` directory, as follows:
`install_path\NetBackup\db\altnames`
- 3 In the `altnames` directory, create a *peername* file.
peername refers to:
 - The granular proxy host name
 See “Configuring the Exchange granular proxy host” on page 37.
 - The off-host client name
 - The private network host name
 - The node names in the cluster
 Create a *peername* file for each node in the cluster.
 - The physical Exchange servers in a DAG
 For a DAG, create one file for each physical Exchange server in the DAG.
 - The destination client name, if it is different than the source client
 For example, consider that you have a source client named `ClientA` and you want to use a proxy host named `ProxyClient`. On the master server, you create a file that is called `proxycient`.
- 4 In the *peername* file, add the name of the source client.
 The source client is the client that originally performed the backup. For clustered clients, use the virtual Exchange name. For a backup within a private network, use the private network host name. For a DAG, use the DAG name; this name should be the client name in the policy.
 The source client is the client that originally performed the backup. For a backup within a private network, use the private network host name.
 For example, in the `proxycient`, include the name `clienta`.

Cataloging an Exchange backup or VMware backup that uses Granular Recovery Technology (GRT)

Reviewer: Updated 10/2/12

As an alternative to duplicating a backup image, you index or catalog the backup without creating a copy. The user can then more quickly browse the backup and perform restores. Use the following command to generate a full Exchange catalog with granular information for the image:

```
bpduplicate -bc_only
```

See the NetBackup command reference for options that may apply. For example, without options, this command operates on all images within a default date range. This command works only on the primary copy of an Exchange image or Exchange view of a VMware image.

Reviewer: Updated 1/31/13

Note that for a VMware backup that protects Exchange, the mailbox user name is not cataloged at the time of the VMware backup.

If you specify a granular proxy host with the `bpduplicate` command, the information for Exchange client and server privileges applies.

See [“Allowing an Exchange server to browse a backup or to redirect a restore to another server or DAG”](#) on page 83.

Configuring the logon account for the NetBackup Client Service when upgrading to NetBackup 7.6

By default, the NetBackup Client Service uses “Local System” account to log on. A different account, called the account for NetBackup Exchange operations, is required for GRT operations so that NetBackup has permissions to perform Exchange backups and restores. See the following topics for information on how to create this account.

See [“Creating a privileged NetBackup user account for EWS access \(Exchange 2010\)”](#) on page 50.

See [“Creating a minimal NetBackup account for Exchange operations \(Exchange 2010\)”](#) on page 51.

See [“Configuring the account for NetBackup Exchange operations \(Exchange 2007\)”](#) on page 52.

See [“Configuring the account for NetBackup Exchange operations \(Exchange 2003\)”](#) on page 54.

Note the following when you configure the logon account for the NetBackup Client Service:

■ *Reviewer: ET 3064051 1/30/13*

For mailbox and public folder backups, you must configure the NetBackup Client Server with the credentials for the account for NetBackup Exchange operations. For those types of backups, you cannot configure the credentials in the Exchange client host properties.

- Configure each client that performs granular operations. To determine which clients to configure, see the following topics:

See [“Exchange granular clients and non-VMware backups”](#) on page 43.

See [“Exchange granular clients and VMware backups”](#) on page 44.

- For an off-host backup, perform the steps on the alternate client.
- In a cluster environment, perform the steps on each database node in the cluster. For Exchange 2010, perform the steps on each database node in the DAG and the CAS server.
- Configure the NetBackup Client Service with the credentials for the account for NetBackup Exchange operations.
See [“About configuring the account for NetBackup Exchange operations”](#) on page 46.
- In previous versions of NetBackup, to perform Granular Recovery Technology (GRT) operations you configured the NetBackup Client Service on each granular client with a different logon account. If you upgraded from an earlier version of NetBackup you can continue to use that configuration, as described in this topic.

Reviewer: ET 3064051 1/30/13

Except for mailbox and public folder backups, you can alternatively configure the Exchange credentials in the Exchange client host properties. Do not configure the credentials in both places.

See [“About the Exchange credentials in the client host properties”](#) on page 39.

- If you use Replication Director to manage your VMware snapshots and snapshot replication, you *must* configure the NetBackup Client Service with the account that has access to the CIFS shared that are created on the NetApp disk array.
See [“Configuring NetBackup with access to the CIFS share on the NetApp disk array”](#) on page 207.

- *Reviewer: I don't know if this is accurate now if the configures the credentials in the client host properties or if they have RD (and configure client host properties and NetBackup Client Service. See message from Craig Bridge I sent to you 12/6/12. Larry thought it should work if the Exchange credentials have the correct privileges, but that it would need to be tested. I guess the privileges*

Configuring the logon account for the NetBackup Client Service when upgrading to NetBackup 7.6

are ACT AS PART OF SYSTEM and privileges to open memory mapped file for SHARED WRITE.

Reviewer: ET2663714 8/17/12

If you use NetBackup for Exchange on a SAN client, use the same account for the NetBackup Client Service and the SAN Client Fibre Transport Service. Alternatively, you can provide the Exchange credentials in the client host properties. In that case, you do not need to use the same credentials for the SAN Client Fibre Transport Service.

To configure the logon account for the NetBackup Client Service when upgrading to NetBackup 7.6

- 1 Open the Windows Services application.
- 2 Double-click on the **NetBackup Client Service** entry.
- 3 Click on the **Log On** tab.
- 4 Provide the credentials for the account for NetBackup Exchange operations. To change the **Log on as** account, you must have administrator group privileges.

The account must include the domain name, followed by the user account, **domain_name\account**. For example, **recovery\netbackup**.

- 5 Type the password.
- 6 Click **OK**.
- 7 Stop and **start** the NetBackup Client Service.
- 8 Close the Services control panel application.

Reviewer: Changed title to reflect support for GRT 1/7/13

Configuring the logon account for the NetBackup Client Service when upgrading to NetBackup 7.6

DRAFT

Configuring Exchange backup policies (non-VMware)

This chapter includes the following topics:

- [About Exchange automatic, user-directed, and manual backups](#)
- [About configuring a backup policy for Exchange Server](#)
- [About configuring snapshot backups of Exchange Server](#)
- [About configuring Instant Recovery backups of Exchange Server](#)
- [Configuring streaming backups of Exchange Server \(Exchange 2007\)](#)
- [Performing a manual backup for an MS-Exchange-Server policy](#)

About Exchange automatic, user-directed, and manual backups

NetBackup provides the following methods to perform backups:

- Automatic
- Manual
- User-directed

For more information on these backup methods and other administrator-directed activities, see the *NetBackup Administrator's Guide, Volume I*.

With automatic backups, the NetBackup administrator can schedule the full backups and the incremental backups that occur automatically and unattended. (Incremental backups can be differential incremental backups or cumulative incremental backups.) Automatic backups meet most backup requirements.

You cannot perform an automatic copy backup. To perform a copy backup, run a user-directed backup.

With manual backups, the administrator can perform immediate backups of the files that are associated with any policy, client, or schedule.

The manual backup option can be useful for the following situations:

- Testing a configuration
- When workstations miss their regular backups
- Before installing new software (to preserve the old configuration)
- Preserving records before a special event such as when companies split or merge

With the Backup, Archive, and Restore interface, the user can perform backups of Exchange Server, mailboxes, and public folders. A user-directed backup produces a copy backup for Exchange, which is a full backup that does not truncate the transaction logs.

About configuring a backup policy for Exchange Server

Note: To configure a backup policy for full VMware backups that protect Exchange Server, you follow a different procedure. Incremental backups must be performed with an MS-Exchange-Server policy.

See [“About protecting Exchange Server data with VMware backups”](#) on page 195.

A backup policy for a database defines the backup criteria for a specific group of one or more clients.

These criteria include the following:

- Storage unit and media to use
- Policy attributes
- Backup schedules
- Clients to be backed up

- Items (database objects) to be backed up

To back up a database environment, define at least one MS-Exchange-Server policy with the appropriate schedules. A configuration can have a single policy that includes all clients, or there can be many policies, some of which include only one client.

Most requirements for database policies are the same as for file system backups. In addition to the policy attributes for this database agent, other attributes are available that you should consider.

See the *NetBackup Administrator's Guide, Volume I*.

Policy recommendations for Exchange Server 2010 and later

Refer to the following recommendations when you create policies for an Exchange Server 2010 or later Database Availability Group (DAG):

- Create a policy that backs up an entire DAG or backs up one or more databases in a DAG. This policy supports full, incremental, and user-directed backups.
- (Exchange 2010) To perform a backup with Granular Recovery Technology (GRT) select the **Enable granular recovery** option.
 This option lets you restore databases and individual mailbox and public folder items. You cannot restore individual mailbox and public folder items from any incremental backups.
- The example policies include the basic policy settings for an Exchange backup. For information on how to create snapshot backup policies, see the following:
 See "[About configuring snapshot backups of Exchange Server](#)" on page 110.

Table 5-1 Example policy that backs up all databases in an Exchange DAG

Policy item	Configuration
Policy type	MS-Exchange-Server
Backup selections	Microsoft Exchange Database Availability Groups:\
Auto backup frequency	Weekly Full Daily Incremental
Enable granular recovery	(Exchange 2010) Optional. Enable this option if you want to restore individual mailbox and public folder objects from the database backup.

Table 5-1 Example policy that backs up all databases in an Exchange DAG
(continued)

Policy item	Configuration
Other configuration	<p>Perform snapshot backups must be enabled.</p> <p>You can include multiple clients on the Clients tab. The client names are the DAG names.</p>

Table 5-2 Example policy that backs up a database for an Exchange DAG

Policy item	Configuration
Policy type	MS-Exchange-Server
Backup selections	<p>Microsoft Exchange Database Availability Groups:\Mailbox Database</p> <p>Microsoft Exchange Database Availability Groups:\forest or domain name\Microsoft Information Store\Mailbox Database</p>
Auto backup frequency	<p>Weekly Full</p> <p>Daily Incremental</p>
Enable granular recovery	(Exchange 2010) Optional. Enable this option if you want to restore individual mailbox and public folder objects from the database backup.
Other configuration	<p>Perform snapshot backups must be enabled.</p> <p>You can only include one client on the Clients tab. A DAG is the client for the policy.</p>

Refer to the following recommendations when you create policies for an Exchange 2010 or later standalone server:

- Create a policy that backs up the Information Store or individual databases. This policy supports full, incremental, and user-directed backups.
- (Exchange 2010) To perform a backup with Granular Recovery Technology (GRT), select the **Enable granular recovery** option.
You can restore databases and individual mailbox and public folder items. You cannot restore individual mailbox or public folder items from any incremental backups that use GRT.
- The example policies include the basic policy settings for an Exchange backup. For information on how to create snapshot backup policies, see the following:
See [“About configuring snapshot backups of Exchange Server”](#) on page 110.

Table 5-3 Example policy that backs up all database in an Exchange 2010 or later standalone server

Policy item	Configuration
Policy type	MS-Exchange-Server
Backup selections	Microsoft Information Store:\
Auto backup frequency	Weekly Full Daily Incremental
Enable granular recovery	(Exchange 2010) Optional. Enable this option if you want to restore individual mailbox and public folder objects from the database backup.
Other configuration	Perform snapshot backups must be enabled.

Table 5-4 Example policy that backs up a database in an Exchange 2010 or later standalone server

Policy item	Configuration
Policy type	MS-Exchange-Server
Backup selections	Microsoft Information Store:\Mailbox Database
Auto backup frequency	Weekly Full Daily Incremental
Enable granular recovery	(Exchange 2010) Recommended. Enable this option if you want to restore individual mailbox and public folder objects from the database backup.
Other configuration	Perform snapshot backups must be enabled.

Policy recommendations for Exchange Server 2007 backups

Refer to the following recommendations when you create database backup policies for Exchange Server 2007:

- Create a policy that backs up the Information Store, a storage group, or an individual database. This policy supports full, incremental, and user-directed backups.

To perform the backup with Granular Recovery Technology (GRT) select the **Enable granular recovery** option. Then you can restore databases and individual mailbox and public folder items. You cannot restore these individual items from any incremental backups that use GRT.

- The example policies include the basic policy settings for an Exchange backup. For more information on how to create policies, see the following:
 See [“About configuring snapshot backups of Exchange Server”](#) on page 110.
 See [“Configuring streaming backups of Exchange Server \(Exchange 2007\)”](#) on page 133.

Table 5-5 Example Exchange 2007 streaming backup or snapshot policy that backs up all the databases

Policy item	Configuration
Policy type	MS-Exchange-Server
Backup selections	Microsoft Information Store:\
Auto backup frequency	Weekly Full Daily Incremental
Enable granular recovery	Optional. Enable this option if you want to restore individual mailbox and public folder objects from the database backup.
Other configuration	For snapshot backups, select Perform snapshot backups .

Table 5-6 Example snapshot policy that backs up a storage group for an Exchange 2007 database

Policy item	Configuration
Policy type	MS-Exchange-Server
Backup selections	Microsoft Information Store:\Storage Group
Auto backup frequency	Weekly Full Daily Incremental
Enable granular recovery	Optional. Enable this option if you want to restore individual mailbox and public folder objects from the database backup.
Other configuration	Select Perform snapshot backups .

Table 5-7 Example Exchange 2007 streaming backup policy that backs up a storage group or a storage group database

Policy item	Configuration
Policy type	MS-Exchange-Server

Table 5-7 Example Exchange 2007 streaming backup policy that backs up a storage group or a storage group database (*continued*)

Policy item	Configuration
Backup selections	Microsoft Information Store:\Storage Group Microsoft Information Store:\Storage Group\Database
Auto backup frequency	Weekly Full Daily Incremental
Enable granular recovery	Optional. Enable this option if you want to restore individual mailbox and public folder objects from the database backup.
Other configuration	Do not select Perform snapshot backups . To ensure that transaction logs are deleted regularly include all databases for a storage group in a full backup policy. Or specify the storage group (not individual databases) in the backup policy. See “ About Exchange backups and transaction logs ” on page 109.

About policy attributes for NetBackup for Exchange

With a few exceptions, NetBackup manages a database backup like a file system backup. Other policy attributes vary according to your specific backup strategy and system configuration.

For more information on policy attributes, see the *NetBackup Administrator’s Guide, Volume I*.

Table 5-8 Policy attribute descriptions for NetBackup for Exchange policies

Attribute	Description
Policy type	Determines the types of clients that can be in the policy. In some cases the policy type determines the types of backups that NetBackup can perform on those clients. To use the Exchange database agent, you must define at least one policy of type that is MS-Exchange-Server.

Table 5-8 Policy attribute descriptions for NetBackup for Exchange policies
(continued)

Attribute	Description
Policy storage	<p><i>Reviewer: 6/27/12, I have a note "for post-7.0, preference is also given to storage units on the alternate client." Should I add this?</i></p> <p>Note that in a Database Availability Group (DAG) environment where the Exchange server is both a client and a media server, policy storage is treated differently. If you want to back up to the local Exchange client that is also a media server, specify a storage unit group. NetBackup automatically selects the local storage unit from the storage unit group during the backup processing. If you specify a single storage unit, all backups use this storage unit.</p>
Allow multiple data streams	<p>Specifies that NetBackup can divide automatic backups for each client into multiple jobs. Each job backs up only a part of the list of backup selections. The jobs are in separate data streams and can occur concurrently. The number of available storage units, multiplex settings, and the maximum jobs parameters determine the total number of streams and how many can run concurrently. Not all directives in the backup selections list allow for multiple database streams.</p> <p>For Exchange 2010 and later, you can create multiple data streams at the database level. For Exchange 2007, you can create multiple data streams at the storage group level.</p>
Enable granular recovery	<p>Allows restores of individual items using Granular Recovery Technology (GRT). Users can only restore individual items from a full backup. (You can perform incremental backups using GRT, but the backup does not save granular information and you cannot restore individual items from an incremental backup.)</p> <p>You can restore individual items only if the backup image resides on a disk storage unit. If you want to retain a granular backup on tape, you must duplicate the image. If you want to restore from a granular backup that was duplicated to tape, you must import the image to a disk storage unit.</p> <p>See “Disk storage units supported with Exchange Granular Recovery Technology (GRT)” on page 79.</p> <p>Exchange Server GRT-enabled backups do not support encryption or compression.</p>
Keyword phrase	A textual description of a backup. Useful for browsing backups and restores.
Snapshot Client and Replication Director	<p>For Exchange 2010 and later you must enable the option Perform snapshot backups for all backup policies.</p> <p>See “About snapshot backups with Exchange Server” on page 112.</p> <p>See “Configuring a VMware policy to back up Exchange Server using Replication Director to manage snapshot replication” on page 206.</p>

Table 5-8 Policy attribute descriptions for NetBackup for Exchange policies
(continued)

Attribute	Description
Use Accelerator	<p>Select this option to use NetBackup Accelerator to potentially increase the speed of full VMware backups. By reducing the backup time, it is easier to perform the VMware backup within the backup window. To use this feature, you must first perform an initial backup with Use Accelerator enabled. Subsequent backup times can then be significantly reduced.</p> <p>Accelerator support for Exchange currently restricts backups to the full schedule type. This restriction also exists for a VMware backup that protects Exchange without Accelerator.</p> <p>This feature requires the Data Protection Optimization Option license. For more details on Accelerator with VMware backups, see the following:</p> <p><i>NetBackup for VMware Administrator's Guide</i></p>
Microsoft Exchange Attributes	<p>Indicates what database backup source you want to use for a DAG or for an Exchange 2007 replication backup (LCR or CCR). For Exchange 2010 or later, you can also indicate a preferred server list.</p> <p>See “Backup source for an Exchange 2010 DAG backup or an Exchange 2007 replication backup” on page 119.</p> <p>See “Configuring a preferred server list for an Exchange 2010 Database Availability Group (DAG)” on page 120.</p>

Adding schedules to a NetBackup for Exchange policy

Each policy has its own set of schedules. These schedules control the initiation of automatic backups and also specify when user operations can be initiated.

To add a schedule to a NetBackup for Exchange policy

- 1 In the **Policy** dialog box, click the **Schedules** tab.
To access the **Policy** dialog box, double-click the policy name in the **Policies** list in the NetBackup Administration Console.
- 2 Click **New**.
- 3 Specify a unique name for the schedule.
- 4 Select the **Type of backup**.
See [“NetBackup for Exchange backup types”](#) on page 98.
- 5 Specify the other properties for the schedule.
See [“About NetBackup for Exchange schedule properties”](#) on page 99.
- 6 Click **OK**.

NetBackup for Exchange backup types

This topic describes the types of backups you can schedule for backups of Exchange Server.

Note: Incremental backups back up the Exchange transaction logs. Therefore, since Exchange 2007 maintains transaction logs at the storage group level, NetBackup performs incremental backups of storage groups, not individual databases within storage groups. NetBackup lets you configure incremental schedules for individual databases. The backup job still runs according to the configured incremental schedules, but the job logs warnings for attempted incremental backups of these objects.

Table 5-9 NetBackup for Exchange backup types

Type of backup	Description
Full backup	<p>This schedule type backs up the Exchange Server database and associated transaction logs. Exchange truncates all committed transaction logs after NetBackup notifies it that the backup succeeded. In replicated environments, the truncation is scheduled and does not occur immediately.</p> <p>By default, transaction logs are not truncated for Instant Recovery backups. You can enable the truncation of logs for this type of backup or you can perform a backup to a storage unit.</p> <p>See “About truncating Exchange transaction logs with Instant Recovery backups” on page 38.</p> <p>See “Truncating Exchange transaction logs by performing a backup to a storage unit” on page 39.</p>
Differential incremental backup	<p>Includes the changes since the last full or differential incremental backup. After NetBackup notifies it that the backup succeeded, Exchange truncates all committed transaction logs. The truncation of the transaction logs sets the context for the next backup.</p> <p>For backups of databases, storage groups, or the entire Information Store, the backup only includes the transaction logs. Individual items cannot be restored for this type of backup if Enable granular recovery is enabled.</p> <p>To perform a full restore the data that is needed is contained in multiple NetBackup images. One image for the full backup and another image for each differential incremental that was performed.</p>

Table 5-9 NetBackup for Exchange backup types (*continued*)

Type of backup	Description
Cumulative incremental backup	<p>Includes the changes since the last full backup or differential incremental backup. (However, most configurations do not mix cumulative and differential incremental backups between full backups.) Exchange does not truncate the logs when the backup is completes. When a series of cumulative incremental backups follows a full backup, transaction logs remain intact since the last full backup.</p> <p>For backups of databases, storage groups, or the entire Information Store, the backup only includes the transaction logs. For Exchange 2007, you also can use this schedule type to back up changes to the mailboxes or the Public Folders. Individual items cannot be restored for this type of backup if Enable granular recovery is enabled.</p> <p>Consider an Exchange Server data recovery scenario where the transaction logs are all intact. You only need to restore the database from the last full backup and the last cumulative-incremental backup. During recovery, Exchange Server replays all the logs that are in the log folder.</p>
User backup	<p>A user backup is not automatically scheduled and is initiated on the target client computer. It is like a snapshot (or a copy backup) of the databases at a given point in time. This backup does not affect the content of ongoing full and incremental backups.</p> <p>For streaming backups, you can configure user backups to truncate the logs.</p> <p>See “Performing user-directed full streaming backups (Exchange 2007)” on page 142.</p> <p>You may want to consider creating a separate policy for user backup schedule types. Then you can easily separate user-directed and scheduled backups when you restore files. If you decide to create separate policies for user backup schedule types, the considerations are similar to those for automatic backups. A backup selections list is not needed because users select the files to restore.</p>

About NetBackup for Exchange schedule properties

This topic describes the schedule properties that have a different meaning for database backups than for file system backups. Other schedule properties vary according to your specific backup strategy and system configuration. Additional information about other schedule properties is available.

See the *NetBackup Administrator’s Guide, Volume I*.

Table 5-10 Description of schedule properties

Property	Description
Type of backup	<p>Specifies the type of backup that this schedule controls. The selection list shows only the backup types that apply to the policy you want to configure.</p> <p>See “NetBackup for Exchange backup types” on page 98.</p>

Table 5-10 Description of schedule properties (continued)

Property	Description
Schedule type	<p>You can schedule a backup in one of the following ways:</p> <ul style="list-style-type: none">■ Frequency This setting is used only for scheduled backups. It is not used for user-directed backups. Frequency specifies the period of time that can elapse until the next backup or archive operation begins on this schedule. For example, assume that the frequency is seven days and a successful backup occurs on Wednesday. The next full backup does not occur until the following Wednesday. Typically, incremental backups have a shorter frequency than full backups.■ Calendar This setting is used only for scheduled backups. It is not used for user-directed backups. The Calendar option allows you to schedule backup operations that are based on specific dates, recurring week days, or recurring days of the month. <p>More information is available on schedule types and Instant Recovery backups.</p> <p>See “Adding schedules for Exchange Instant Recovery” on page 130.</p> <p>See “Schedules settings in Exchange Instant Recovery policies” on page 131.</p>
Retention	<p>Specifies a retention period to keep backup copies of files before they are deleted. The retention level also denotes a schedules priority within the policy. A higher level has a higher priority. Set the time period to retain at least two full backups of your database. In this way, if one full backup is lost, you have another full backup to restore. For example, if your database is backed up once every Sunday morning, you should select a retention period of at least 2 weeks.</p>

Adding clients to a NetBackup for Exchange policy

The **clients** list contains a list of the clients that are backed up during an automatic backup. A NetBackup client must be in at least one policy but can be in more than one.

For a NetBackup for Exchange policy, clients you want to add must have the following software installed:

- Exchange Server
- NetBackup client or server

Additional requirements exist for clients that use Granular Recovery Technology.

See [“Exchange granular clients and non-VMware backups ”](#) on page 43.

To add clients to a NetBackup for Exchange policy

- 1 In the **Policy** dialog box, click the **Clients** tab.
 To access the **Policy** dialog box, double-click the policy name in the **Policies** list in the NetBackup Administration Console.
- 2 Click **New**.
- 3 Type the name of the client and press **Enter** (Windows) or click **Add** (Java).
 Note the following:
 - If Exchange is clustered or in a Database Availability Group (DAG), specify the virtual Exchange name that represents that cluster or DAG.
 You can also use a DAG node name as the client in the policy, but only local databases are protected and are cataloged under that node name. Any attempts to back up databases on other nodes fail.
 - For off-host backups, the client name should be the name of the primary client.
- 4 (Windows) To add another client, repeat step 2 and step 3.
- 5 (Java) To add another client, repeat step 3.
- 6 If this client is the last client you want to add, click **OK**.
- 7 (Java) In the **Policy** dialog box, click **Close**.

Adding backup selections to an Exchange policy

The backup selections list defines the Exchange objects to back up and the grouping of Exchange objects for multiple data streams. Exchange objects are defined through directives. You can append an individual object name to a directive to specify a database or storage group. You can use wildcards to specify a group of such objects.

Note: In a backup policy, include directives from only one directive set. For example, do not add `Microsoft Exchange Database Availability Groups:\` (a DAG directive) and `Microsoft Information Store:\` (a standalone database directive) to the same policy.

The following directives exist for database and storage group backups:

Table 5-11 NetBackup for Exchange Server directive sets and directives

Directive set	Directive(s)	Notes
MS_Exchange_Database	NEW_STREAM Microsoft Information Store:\	This directive set applies to Exchange 2010 and later standalone servers and to Exchange 2007. See “Notes and limitations for creating a backup selections list for Exchange 2007 streaming database backups” on page 135. See “About excluding Exchange items from backups” on page 106.
MS_Exchange_Database_Availability_Groups	NEW_STREAM Microsoft Exchange Database Availability Groups:\	

Refer to the following topics when you add backup selections:

- See [“Adding Exchange entries to a backup selections list by browsing \(Windows only\)”](#) on page 102.
- See [“Adding Exchange entries to the backup selections list manually”](#) on page 103.
- See [“Performing Exchange backups with multiple data streams”](#) on page 103.
- See [“About excluding Exchange items from backups”](#) on page 106.

Adding Exchange entries to a backup selections list by browsing (Windows only)

On Windows systems, you can browse for Exchange objects and add them to the backup selections list. Alternatively, you can specify the objects manually.

To add Exchange entries to the backup selections list by browsing (Windows only)

- 1 In the **Policy** dialog box, click the **Backup Selections** tab.
- 2 Click **New**.
- 3 Click the **Remote Folder** icon.
- 4 Navigate to and click the Exchange object to back up and click **OK**.
- 5 If necessary, edit the entry.
 - Append the object name to the new entry.
 - If a mailbox specification without wildcards does not end with a backslash, add it.

- Add wildcard characters if you want to define groups of objects or use multiple data streams.
 See [“Performing Exchange backups with multiple data streams”](#) on page 103.
 See [“Using wildcards in an Exchange backup selections list”](#) on page 104.

6 Click **OK**.

Adding Exchange entries to the backup selections list manually

You can add database objects manually to the backup selections list, if you do not want to use the browse feature.

To manually add entries to the backup selections list

- 1 In the **Policy** dialog box, click the **Backup Selections** tab.
- 2 Click **New**.
- 3 Click the **Directives** button.
- 4 Select the directive set.
- 5 Select the directive.
- 6 Click **OK**.
- 7 Edit the new entry if you want to define groups of objects or use multiple data streams.
 See [“Performing Exchange backups with multiple data streams”](#) on page 103.
- 8 Click **OK**.

Performing Exchange backups with multiple data streams

When you enable multiple data streams, backups are divided into multiple jobs. Each job backs up only a part of the backup selections list. To use multiple data streams, enable **Allow multiple data streams** on the **Attributes** tab for the policy.

You can choose to have NetBackup automatically determine where to begin new streams by adding an asterisk (*) after the directive. Or you can control where each stream begins by inserting the `NEW_STREAM` directive at a certain point or points in the backup selections list. If you use wildcard characters to define Exchange objects in the backup selections list, those objects are backed up in multiple streams.

When you back up multiple Exchange 2010 or later databases, NetBackup groups the backup jobs by the selected server. One snapshot is performed for all of the replicated databases on a given server. Another snapshot is performed for all the

active databases on the server. Multistreaming then applies to the database backups that are performed on each snapshot.

For more information on the multiple data streams feature, see the following:

NetBackup Administrator's Guide, Volume I

Using multiple datastreams with Exchange Database Availability Groups (DAG)s

When you back up databases in a Database Availability Group (DAG), NetBackup selects the server to back up each database according to your data source and preferred server list settings. The backup jobs are grouped by server. From your backup selections list, all of the databases that have passive copies on a given server are grouped under one snapshot job. They are then backed up by one or more child backup jobs. All of the databases that have active copies on the server are grouped under another snapshot job, followed by one or more backup jobs.

Note: Use explicit `NEW_STREAM` directives in a DAG only when you are confident which servers will back up which databases.

The `NEW_STREAM` directive works as follows:

- When you do not enable multiple backup streams, all of the databases for a snapshot job are backed up in a single backup job.
- When you enable multiple backup streams and do not specify any `NEW_STREAM` directives, each database is backed up in its own backup job.
- When you enable multiple backup streams and do specify `NEW_STREAM` directives in your policy, then NetBackup tries to group the database backups into jobs according to the placement of the `NEW_STREAM` directives in the backup selection list. The result is affected by the grouping of database backups into snapshot jobs. NetBackup separates backup jobs after any database that is followed by a `NEW_STREAM` directive in the policy.

See [“About excluding Exchange items from backups”](#) on page 106.

See [“Performing Exchange backups with multiple data streams”](#) on page 103.

Using wildcards in an Exchange backup selections list

Wildcard characters can be used to define groups of databases and storage groups. This way multiple objects can be backed up without having to specify the objects individually in the backup selections list. Multiple data streams must also be enabled. If this option is not enabled, the backup fails.

See [“Performing Exchange backups with multiple data streams”](#) on page 103.

Table 5-12 Supported wildcard characters

Wildcard character	Action
Asterisk (*)	Use as a substitute for zero or more characters. Specify the asterisk as the last character in the string. Example: To specify all objects that start with an <code>a</code> use <code>a*</code> .
Question mark (?)	Use as a substitute for one or more characters in a name. Example 1: The string <code>s?z</code> processes all objects that have <code>s</code> for a first character, any character for a second character, and <code>z</code> for a third character. Example 2: The string <code>Data??se</code> processes all objects that have <code>Data</code> as the first four characters, any characters for the fifth and sixth characters, and <code>se</code> as the seventh and either characters.
Left & right brackets ([...])	These wildcard characters are not supported for the Microsoft Information Store:\ directive or for the Microsoft Exchange Database Availability Groups:\ directive.

The following rules apply when wildcard characters are used in the backup selections list:

- Only one wildcard pattern per backup selections list entry is allowed.
- If a wildcard pattern is not honored it is treated literally.
- Wildcard patterns are honored only in the final segment of the path name.

Correct

```
Microsoft Information Store:\*
Microsoft Information Store:\StorageGroup?
Microsoft Information Store:\Database*
Microsoft Information Store:\Data??se
Microsoft Information Store:\Storage Group*
Microsoft Information Store:\Storage?G?oup
Microsoft Exchange Database Availability Groups:\*
Microsoft Exchange Database Availability Groups:\Database*
Microsoft Exchange Database Availability Groups:\Data??se
```

Incorrect

Microsoft Information Store:\StorageGroup?\Mailbox Database

About excluding Exchange items from backups

If you do not want to back up certain databases or storage groups, you can create an exclude list. When NetBackup runs a NetBackup for Exchange backup policy, NetBackup ignores the items that appear in the exclude list.

For more information on how to create an exclude list by using the NetBackup Administration Console, see one of the following:

- See [“Configuring exclude lists for Exchange clients”](#) on page 107.
- The *NetBackup Administrator’s Guide, Volume I*.

NetBackup excludes certain files and directories by default. These default exclusions always appear in the Administration Console’s exclude list. The default exclusions are as follows:

- C:\Program Files\Veritas\NetBackup\bin\bprd.d*.lock
- C:\Program Files\Veritas\NetBackup\bin\bpsched.d*.lock
- C:\Program Files\Veritas\NetBackupDB\data*
- C:\Program Files\Veritas\Volmgr\misc*

For Exchange 2010 or later, you can exclude specific databases from a backup, both for the databases that exist in a DAG or on a standalone Exchange server. You can specify the exclude list entry under **All Policies** or under a specific policy or schedule.

For Exchange 2007 you must specify the storage group name in the exclude list. Entering a database is not valid because Exchange requires that VSS backups must contain the entire storage group (for log truncation purposes). The exclude list entry can be specified under **All Policies** or under a specific policy or schedule.

[Table 5-13](#) provides examples of Exchange 2010 entries you can add to an exclude list.

Table 5-13 Example Exchange 2010 or later entries in an exclude list

This entry ...	excludes ...
Microsoft Information Store:\Database2	<p>The database named <i>Database2</i>.</p> <p>You can use the same Microsoft information Store:\ directive for both DAG and standalone databases.</p> <p>Note that Microsoft Exchange Database Availability Groups:\Database 2 is an invalid exclude entry.</p>

[Table 5-14](#) provides examples of Exchange 2007 entries you can add to an exclude list.

Table 5-14 Example Exchange 2007 entries in an exclude list

This entry ...	excludes ...
Microsoft Information Store:\Storage_Group1	The storage group named <i>Storage_Group1</i> .

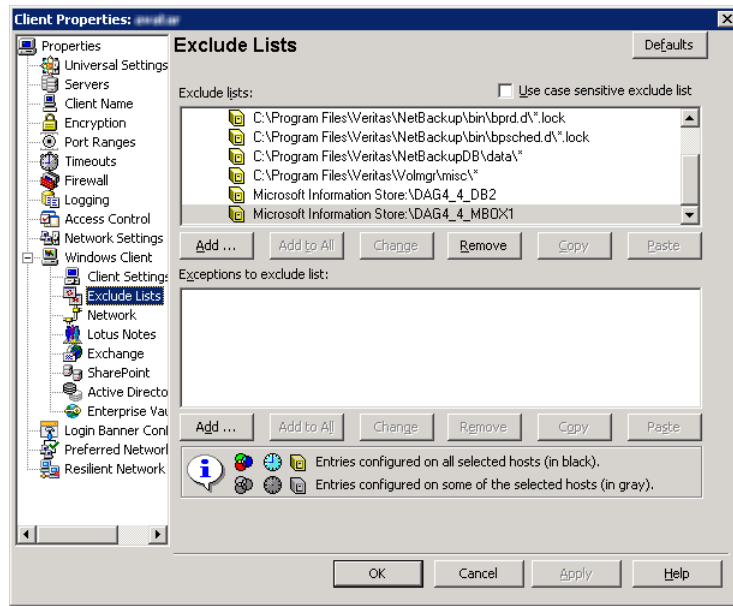

Configuring exclude lists for Exchange clients

This topic describes how to exclude items from an Exchange backup. For more information about this topic, see the following:

See [“About excluding Exchange items from backups”](#) on page 106.

The following figure shows an exclude list with two databases:

Figure 5-1 Exclude list for two Exchange databases

Note: For backups in a clustered or replicated environment, select each node and perform the configuration procedure on each node. You must configure the same settings on each node. If you change the attributes for the virtual name of the client, NetBackup updates only the active node or current node.

To configure an Exchange client exclude list

- 1 Open the NetBackup Administration Console or the Remote Administration Console.
- 2 In the left pane, expand **NetBackup Administration > Host Properties > Clients**.
- 3 In the right pane, select the Exchange client(s) that you want to configure.
- 4 Click **Actions > Properties**.
- 5 Expand **Windows Client** and click **Exclude Lists**.
- 6 Click **Add**.
- 7 Specify objects to exclude in one of the following ways:
 - In the **Policy** field, select <<All Policies>> or type the name of a specific policy.

- In the **Schedules** field, select <<All Schedules>> or type the name of a specific schedule.
- In the **Files/Directories** field, type the name of a storage group, database in the following format:

`Microsoft Information Store:\name`

For *name*, specify the name of a storage group or Exchange 2010 or later database, as follows:

- To exclude a specific storage group from an Exchange 2007 backup, type the name of a specific storage group. Do not type the name of a database in this field. For log truncation purposes, Exchange requires that snapshot (VSS) backups contain the entire storage group.
- To exclude a specific database from an Exchange 2010 or later backup, type the name of a database to be excluded, even for DAG backups.

When you specify a storage group or Exchange 2010 or later database to exclude, do not include any wildcard characters.

- 8 (Conditional) Repeat step 3 through step 7 for the other nodes in the environment.

Perform this step if the NetBackup environment is clustered or replicated.

If you specify the name of the virtual client, only the active node or current node is updated. For the changes to be effective throughout the cluster, repeat the configuration steps on each node.

About Exchange backups and transaction logs

For performance and recoverability, the Exchange database uses transaction logs to accept, track, and maintain data. All transactions are first written to transaction logs and memory, and then committed to their respective databases. Transaction logs can be used to recover Information Store databases in the event that a failure corrupted the database. The Exchange 2010 or later Information Store can have multiple separate databases, each of which has its own set of transaction logs. For Exchange 2007, the databases in each storage group share a common set of transaction logs.

Transactions are first written to the log file and then later written to the database. The effective database is a combination of the uncommitted transactions in the transaction log file and the actual database file. When the log file is filled with transaction data, it is renamed and a new log file is created. When the log file is renamed, the other renamed log files are stored in the same subdirectory. The renamed log files are named in a sequential numbering order, in hexadecimal.

For Exchange 2007 and later the database transaction log for the Information Store is named `EXXXXXXXXX.log`. `XX` is the database number or storage group number (in hex). `YYYYYYY` is the log file number (in hex). The size of the transaction logs is 1 MB.

After every 1 MB of transaction log data is written, a new log is created. The log is created even though the transaction data may not be committed to the database. There may be several transaction logs that contain uncommitted data, therefore they cannot be purged.

Exchange 2010 or later transaction logs get committed to their database over time or when the services are brought down. Any transactions that existed in log files and not in the database file are committed to the database.

Exchange 2007 transactions in log files are committed to the respective database over time, or when the service shuts down normally. For example, consider when the Information Store service experiences a normal shutdown (service shuts down with no errors). Any transactions that existed in log files and not in the database file are committed to the database.

Do not manually purge log files. Instead, purge logs through the backup process. For backups of a replicated copy (LCR, CCR or DAG), the log truncation is scheduled. It starts with the active copy when Exchange has the resources to start truncation. It does not happen instantly after a backup as with non-replicated copies.

For information on how transaction logs are truncated, see the following topics:

- See “[NetBackup for Exchange backup types](#)” on page 98.
- See “[Adding schedules for Exchange Instant Recovery](#)” on page 130.

About configuring snapshot backups of Exchange Server

Use the following steps to configure snapshot backups of Exchange Server.

Table 5-15 Configuring a snapshot backup of Exchange Server

Step	Action	Description
Step 1	Review the configuration and the licensing requirements for snapshot backups.	See “ Snapshot Client configuration and licensing requirements for Exchange snapshot backups ” on page 27.
Step 2	Additional configuration is required if you want to restore mailbox items from a database backup (using Granular Recovery Technology or GRT).	See “ About configuring the account for NetBackup Exchange operations ” on page 46.

Table 5-15 Configuring a snapshot backup of Exchange Server (*continued*)

Step	Action	Description
Step 3	If you want to perform off-host backups, review the installation requirements for that type of backup.	See “Requirements for Exchange off-host backups” on page 28.
Step 4	Review the general configuration requirements for snapshot operations.	See “Configuration requirements and recommendations for the Exchange Server when performing snapshot operations” on page 113. See “Limitations of Exchange snapshot operations” on page 113.
Step 5	Review the configuration requirements for Exchange Server.	See “Configuration requirements and recommendations for the Exchange Server when performing snapshot operations” on page 113.
Step 6	Choose which transaction logs to back up.	See “About backing up all or only uncommitted Exchange transaction log files with snapshot backups” on page 36.
Step 7	Configure consistency checks.	See “Consistency checks on Exchange snapshot backups” on page 114. See “About consistency checks options for an Exchange 2010 or later backup” on page 39. See “About configuring a pause in consistency checks for Exchange 2007” on page 36.
Step 8	Configure an MS-Exchange-Server policy that has the applicable snapshot attributes selected.	See “Configuring a snapshot policy for Exchange Server” on page 115.
Step 9	For a Database Availability Group (DAG), choose whether to back up the passive or the active copy. You can also define a preferred server list from which to back up the passive copy. For Exchange 2007 replication backups, choose whether to back up the active or passive server.	See “Backup source for an Exchange 2010 DAG backup or an Exchange 2007 replication backup” on page 119. See “Configuring a preferred server list for an Exchange 2010 Database Availability Group (DAG)” on page 120.
Step 10	Configure the snapshot volume that you want to use during the backup process.	
Step 11	For Exchange 2007, disable circular logging for all Exchange storage groups. For Exchange 2010 or later, disable circular logging for all databases.	

About snapshot backups with Exchange Server

NetBackup for Exchange Server includes support for snapshot backups. NetBackup for Exchange Server can back up and restore Exchange objects by taking snapshots of the component files. Data is captured at a particular instant. The resulting snapshot can be backed up without affecting the availability of the database. These snapshots are backed up to tape or to the storage unit.

A separate Snapshot Client license provides additional features for snapshot backups. You can configure the snapshot image for Instant Recovery and you can configure an alternate client to perform the snapshot backup.

NetBackup for Exchange supports the Microsoft Volume Shadow Copy Service (VSS) for creating a snapshot image. The actual VSS provider that is used is dependent on your hardware environment and software environment. A list of the VSS providers available for use with NetBackup for Exchange Server is available.

See the *NetBackup Snapshot Client (Advanced Client) OS, Arrays, and Database Agent Compatibility* list.

The following Snapshot Client features are available for use with NetBackup for Exchange Server:

- | | |
|------------------|--|
| Snapshot backup | A snapshot is a disk image of the client's data. NetBackup backs up the data from the snapshot volume, not directly from the client's original volume. Client operations and user access are allowed to continue without interruption during the backup. |
| Instant Recovery | <p>NetBackup supports Instant Recovery backups with Exchange 2007 or later for non-clustered and non-replicated environments. Instant Recovery requires a separate Snapshot Client license key.</p> <p>This feature makes backups available for "instant recovery" from disk. Instant Recovery combines snapshot technology with the ability to do rapid disk-based restores. Optionally, the image is retained on disk as well as backed up to storage.</p> <p>To perform an Instant Recovery, one of the following methods is used:</p> <ul style="list-style-type: none">■ Files are copied back from the snapped volume to the original volume■ The volume is rolled back |

Off-host backup

NetBackup supports off-host backups of Exchange using an alternate client in non-clustered and non-replicated environments. Off-host backups require a separate Snapshot Client license key.

Off-host backups use a second, or alternate, client to perform the backup on behalf of the primary client. Compared to local Snapshot Client backups, this approach reduces the backup I/O burden on the primary client.

NetBackup also supports off-host Instant Recovery backups for Exchange 2007 and later.

Limitations of Exchange snapshot operations

The following limitations exist when you perform snapshot operations with NetBackup for Exchange:

- Data movers are not supported with off-host backups. Only alternate clients are supported for off-host backups.

The following additional limitations exist for snapshot operations performed with Exchange 2007:

- Snapshot backups are supported only for the full Information Store, or storage groups. The entire Information Store or storage group must be selected for backup. (However, you can select individual databases for restore.)
- Snapshot backups are not supported for individual Exchange mailboxes or public folders.
- You cannot restore snapshot backups and streaming backups in the same restore job.
- An incremental backup must be of the same type (streaming or snapshot) as the last full backup.

Configuration requirements and recommendations for the Exchange Server when performing snapshot operations

Reviewer: Removed Exchange 2003

Review the following requirements and recommendations before you perform snapshot backups:

- Complete the necessary installation and configuration for snapshot backups. See [“Snapshot Client configuration and licensing requirements for Exchange snapshot backups”](#) on page 27.
- Mount databases before you perform a backup.

- The volume(s) that contains the Exchange databases should be dedicated to Exchange only. Other types of databases (for example, SQL Server) should not reside on the volume(s). Only Exchange objects are included in a snapshot backup.
- Transaction logs or Exchange system files should not reside on the same volume as the Exchange database files (`edb` and `stm`).
- (Exchange 2007) Restore all databases in a storage group at the same time. Also restore all the databases before the transaction logs are committed and the databases are mounted. Transaction logs are committed at a storage group level, rather than at a database level.
- For off-host backups using Storage Foundations for Windows (SFW), SFW exports and imports at the disk level. The volumes that you back up must constitute whole disks.
- If you want to create a virtual storage unit for an Exchange 2007 CCR environment when the Exchange cluster is also configured as a SAN Media server, see the following:
<http://www.symantec.com/docs/TECH69539>

Consistency checks on Exchange snapshot backups

Reviewer: REMoved Exchange 2003 8/2/12

NetBackup is configured to run consistency checks for Exchange snapshot backups. Consistency checks are required for Exchange 2007 or for a standalone Exchange 2010 server. Consistency checks are not required for an Exchange 2010 Database Availability Group (DAG) because of the checks that are performed during replication.

The consistency check runs with the proper options against the files that exist on the snapshot. If any of the files fail the consistency check, the backup fails and the backup image is discarded. The Exchange VSS Writer is notified of the failure. When this kind of backup failure occurs, Exchange does not truncate log files. Failure of the consistency check may be an indication of either database corruption or a problem with the snapshot.

For local snapshot backups, NetBackup uses the Microsoft consistency check API. This API allows the user to view problems or information in the application event logs.

For off-host backups, the consistency checks are run on the off-host client rather than on the primary client. Symantec recommends that you install the Exchange System Management Tools on the alternate client. NetBackup performs the backup faster with this configuration. If the Exchange System Management Tools are not installed on the alternate client, the following occurs:

- (Exchange 2010) If you choose not to install the Exchange System Management Tools, the backup may fail. You must install the VC9 runtime DLLs on the alternate client. These DLLs can be downloaded from Microsoft x64 VC9 download page:
<http://www.microsoft.com/downloads/details.aspx?familyid=BD2A6171-E2D6-4230-B809-9A8D7548C1B6&displaylang=en>

- `bpfis` logs a message. The message indicates that the DLL cannot be loaded and that `eseutil` is used for the consistency check.

- NetBackup performs the consistency check during the snapshot import step.

More information is available about configuring consistency checks for Exchange 2010 and the pause option for Exchange 2007.

See “[About consistency checks options for an Exchange 2010 or later backup](#)” on page 39.

See “[About configuring a pause in consistency checks for Exchange 2007](#)” on page 36.

Configuring a snapshot policy for Exchange Server

To configure a snapshot policy with Instant Recovery, you follow a different procedure.

See “[About configuring Instant Recovery backups of Exchange Server](#)” on page 122.

If you have existing streaming backup policies and you upgraded to Exchange 2010, you must update your backup policies. Exchange 2010 backup policies require that **Perform snapshot backups** is enabled. You may have to update the backup selections list with the correct directives.

With a snapshot policy you can optionally perform an off-host backup. Also refer to the following topics for policy recommendations:

See “[Policy recommendations for Exchange Server 2010 and later](#)” on page 91.

See “[Policy recommendations for Exchange Server 2007 backups](#)” on page 93.

To configure a snapshot policy for Exchange Server

- 1 *Writer: Add other steps before this. Also to IR policy.*
Create a new policy or open the policy you want to configure.
- 2 In the **Policy** dialog box, click the **Attributes** tab.
- 3 In the **Policy type** list, click **MS-Exchange-Server**.
- 4 Select the **Policy storage**.
- 5 Click **Perform snapshot backups**.

- 6 In the **Snapshot Client** group, click **Options**.
 - 7 In the **Snapshot Client Options** dialog box, from the **Snapshot method** list, click **VSS**.
 - 8 Adjust the configuration parameters.
- See “[Snapshot options for backups of Exchange Server](#)” on page 118.
- 9 (Optional) To perform off-host backups with Exchange 2007 or with an Exchange 2010 standalone server, do the following:

- Click **Perform off-host backup**.
- In the **Use** box, select **Alternate Client**.
- In the **Machine** box, type the name of the alternate client.

If you use the SFW VSS provider, review the additional installation requirements and configuration that exist.

See “[Requirements for Exchange off-host backups](#)” on page 28.

Change Policy - policy

Attributes | Schedules | Clients | Backup Selections

Policy type: MS-Exchange-Server

- 10 Optional: To divide backups into multiple jobs, click **Allow multiple data streams**.
- 11 To enable restores of individual items from database backups, click **Enable granular recovery**.
 See [“Configuring an Exchange backup that uses Granular Recovery Technology \(GRT\) \(non-VMware backups\)”](#) on page 56.
- 12 For an Exchange 2010 DAG or Exchange 2007 replication backup, in the **Microsoft Exchange Attributes** group choose the **Database backup source**.

See [“Backup source for an Exchange 2010 DAG backup or an Exchange 2007 replication backup ”](#) on page 119.

See [“Configuring a preferred server list for an Exchange 2010 Database Availability Group \(DAG\)”](#) on page 120.

- 13 To configure schedules, click the **Schedules** tab.

See [“Adding schedules to a NetBackup for Exchange policy”](#) on page 97.

- 14 Use the **Clients** tab to specify clients to be backed up by this policy.

See [“Adding clients to a NetBackup for Exchange policy”](#) on page 100.

For a DAG policy, the client name is the name of the DAG and not the client on which the backup is run. If you want to use a particular Exchange server, add it to the preferred server list.

See [“Configuring a preferred server list for an Exchange 2010 Database Availability Group \(DAG\)”](#) on page 120.

For off-host backups, the client name should be the name of the primary client. The alternate client must be the client that shares the disk array. This option may require additional configuration.

See to the *NetBackup Snapshot Client Administrator’s Guide*.

- 15
- Use the **Backup Selections** tab to enter the directives or browse for Exchange objects.

See “[Notes and limitations for creating a backup selections list for Exchange 2007 streaming database backups](#)” on page 135.

Off-host backups with the SFW VSS provider require that you back up storage groups only on the same SFW disk group.
- 16
- Click **OK** to close the dialog box.

Snapshot options for backups of Exchange Server

Table 5-16 lists the options that are available for snapshot backups.

Table 5-16 Snapshot options

Parameter	Value	Description
Provider Type	0-auto	The VSS Provider is automatically selected based on the providers available for the snapshot volumes.
	1-system	Only the default Microsoft VSS Provider is used.
	2-software	Currently, the only software VSS Provider that is supported is SFW. If this provider is not in control of one of the volumes that is required for the backup, the backup fails.
	3-hardware	The applicable hardware VSS Provider is used for the volumes. If a hardware provider is not available for one of the volumes that is required for the backup, the backup fails.
Snapshot Attribute	0-unspecified 1-differential 2-plex	The setting for this option depends on the configuration of the snapshot volume.
Maximum Snapshots (Instant Recovery only)		<p>This option defines the number of snapshots that is retained for Instant Recovery. When this threshold is reached, a snapshot is automatically snapped back or deleted, depending on the VSS provider and its configuration before another snapshot backup is performed.</p> <p>Select a number that is appropriate for the number of volumes that you have available to become snapshot volumes for your backup. If you use the Microsoft VSS Provider, consider the amount of disk space available for the virtual snapshots that it creates.</p>

Backup source for an Exchange 2010 DAG backup or an Exchange 2007 replication backup

Reviewer: Updated 9/27/12 to accurately use copy vs. node for 2010 vs. 2007

For backups of an Exchange 2010 DAG you can choose whether to back up the active or the passive copy of the database. For backups of an Exchange 2007 replicated environment (LCR or CCR), you can choose whether to back up the active or the passive server or node. The client backs up and catalogs the selected database as if it were a local snapshot backup.

See [“Configuring a preferred server list for an Exchange 2010 Database Availability Group \(DAG\)”](#) on page 120.

On the **Attributes** tab of the policy, for the backup source select one of the following:

Passive copy only (or passive copy from preferred server list)

This option backs up the **passive copy** of a database or passive server if the database is **all** of the following: mounted, included in the backup selections list, and healthy. For an Exchange 2010 DAG, you must **also configure** a preferred **server** list. In that case, NetBackup backs up the passive copy on a server in the preferred server list, provided that the database meets the other criteria.

Reviewer: Updated 10/1 with text from 7.0 doc and noted list not req'd for db with active copy only.

If a database **does not have** any passive copies, then it is backed up on its active (and only) server. For example, the Public Folder database only has an active copy. A preferred server list is not required for any databases that only have an active copy.

Active copy only

This option backs up the active copy of a database or active node. For Exchange 2010, the preferred server list is ignored.

Passive copy and if not available the active copy

This option backs up the passive copy of a database or the passive server that is all of the following: mounted, included in the backup selections list, and healthy. For an Exchange 2010 DAG, you can also configure a preferred server list. In that case, NetBackup backs up the passive copy on a server in the preferred server list, provided that the database meets the other criteria. If the passive copy is not available and healthy, NetBackup backs up the active copy.

This option is the default.

Configuring a preferred server list for an Exchange 2010 Database Availability Group (DAG)

You can create preferred server configurations for an Exchange 2010 Database Availability Groups (DAG). The preferred server list is a collection of one or more servers in the DAG that you select as preferred backup sources. Preferred server configurations take priority as backup sources in instances where database copies are replicated between multiple servers. The preferred server list is required for **Passive copy only**, unless the database only has an active copy. The list is ignored for **Active copy only** and is optional for **Passive copy and if not available the active copy**.

You can let NetBackup choose the best server from which to back up the replicated database copies or you can designate a preferred server list. Designating a preferred server list gives you more control over your backup jobs. For example, you can configure a list of preferred servers that **are local** to avoid having to back up replicated data over your WAN. You can arrange the servers in order of preference. Or you may have one node of a DAG that contains passive copies for all or most of your databases and that is also a fast media server. Add only this server to your preferred list to make the backup more efficient.

For each replicated database you select for backup, NetBackup picks a server as follows:

- The server is the one from which NetBackup most recently attempted to back up the database.
- The backup attempt on the server was successful.
NetBackup tracks the success or failure of backup attempts to determine which Exchange node to perform a passive copy database backup from.
See [“Backup status for Exchange Database Availability Groups \(DAGs\) and the preferred server list”](#) on page 121.
- The server is included in the preferred server list.

If this algorithm does not choose a server, the database is not backed up. A message appears in the progress log identifying each database that is skipped for this reason.

To configure a preferred server list

- 1 In the **Policy** dialog box, click the **Attributes** tab.
- 2 In the **Microsoft Exchange Attributes** group, from the **Database backup source** list, select **Passive copy only**.

See [“Backup source for an Exchange 2010 DAG backup or an Exchange 2007 replication backup”](#) on page 119.

- 3 Click **Preferred server list**.

- 4 In the **Name** box, type the fully qualified domain name (FQDN) of the DAG node you want to add to the list.
- 5 Click **Add**.
- 6 Add any other DAG nodes.
- 7 Use the up and down buttons to indicate the order in which you want NetBackup to select the servers.
- 8 Click **OK**.

See [“Backup status for Exchange Database Availability Groups \(DAGs\) and the preferred server list”](#) on page 121.

Backup status for Exchange Database Availability Groups (DAGs) and the preferred server list

In an Exchange 2010 Database Availability Groups (DAG) environment, NetBackup tracks the success or failure of a backup attempt for each passive copy database backup. This information is stored in the Backup Status database on the NetBackup master server. This status is used in subsequent backup attempts for each database in a DAG. It helps determine from which Exchange node to perform a passive copy database backup.

NetBackup chooses a server from the preferred server list for a subsequent passive copy database backup attempt as follows:

If the last backup was successful and the last backup server exists in the preferred server list...

NetBackup uses that same server.

If the last backup was successful but the last backup server does not exist in the preferred server list...

NetBackup chooses a server from the list based on the order they appear.

If the last backup attempt failed...

NetBackup chooses a server from the list based on the order they appear. The last failed server is effectively pushed to the bottom of the list.

If no backup status exists for a database...

NetBackup chooses a server from the list based on the order they appear.

If no backup status exists for a database
and
if the preferred server list is not
configured or if no servers in the
preferred server list are relevant for an
Exchange database...

NetBackup ranks the health of the passive
copies of a database to determine the
server.

To have NetBackup use a particular server for the subsequent passive copy
database backup attempt, change the backup status for the database. Indicate
that the last successful backup came from the desired server with the following
command:

```
bpclient -client DAG_Name -update -exdb  
database_name:server_name:0:0:0
```

See [“Displaying and resetting the Backup Status for a Database Availability Group \(DAG\)”](#) on page 229.

See [“Configuring a preferred server list for an Exchange 2010 Database Availability Group \(DAG\)”](#) on page 120.

About configuring Instant Recovery backups of Exchange Server

Table 5-17 Configuring Instant Recovery backups of Exchange Server

Step	Action	Description
Step 1	For Exchange 2007, disable circular logging for all Exchange storage groups. For Exchange 2010, disable circular logging for all databases.	
Step 2	Review the configuration and the licensing requirements for snapshot backups.	See “Snapshot Client configuration and licensing requirements for Exchange snapshot backups” on page 27.
Step 3	Review the installation requirements for Instant Recovery backups.	See “Requirements for Exchange Instant Recovery backups” on page 29.

Table 5-17 Configuring Instant Recovery backups of Exchange Server
(continued)

Step	Action	Description
Step 4	Review the general configuration requirements for snapshot operations.	See “Configuration requirements and recommendations for the Exchange Server when performing snapshot operations” on page 113. See “Limitations for Exchange Instant Recovery operations” on page 126. See “About Storage Foundations for Windows (SFW) and Exchange Instant Recovery” on page 126. See “About Exchange Instant Recovery with the Microsoft VSS Provider” on page 127.
Step 5	Review the configuration requirements for Exchange Server for Instant Recovery operations.	See “About configuration requirements for the Exchange Server when you use Instant Recovery” on page 127.
Step 6	Choose which transaction logs to back up.	See “About backing up all or only uncommitted Exchange transaction log files with snapshot backups” on page 36.
Step 7	Configure a pause in consistency checks.	See “About configuring a pause in consistency checks for Exchange 2007” on page 36.
Step 8	Review the backup policy recommendations for Instant Recovery backups.	See “Policy recommendations for Exchange Instant Recovery” on page 125.
Step 9	Configure an MS-Exchange-Server policy that has the Instant Recovery attribute selected and the Snapshot Client options that you want.	See “Configuring an Exchange snapshot policy with Instant Recovery” on page 128.
Step 10	Configure one snapshot volume for each backup image that you need to retain on disk.	

About Exchange Instant Recovery methods

If the snapshot is preserved with the Instant Recovery option, NetBackup restores the database using rollback of the snapshot volume(s) when appropriate. Usually, a rollback of the snapshot volume(s) that contain the Exchange files is the fastest way. However, the whether or not a rollback is appropriate depends on several things: the configuration of the Exchange database files, the contents of the volumes, and configuration of the disk array. If a volume rollback cannot be

performed, the files that are required for restoration are copied from the snapshot volume to the destination volume. Instant recovery of Exchange differs from Instant Recovery of a file system. For Exchange, NetBackup decides which recovery method to use. For file system restores, the user chooses the Instant Recovery method.

NetBackup uses the following methods during an Exchange database restore to restore the physical files:

Volume rollback	The entire volume is rolled back, or resynchronized, by using the snapshot. This method overwrites the entire volume with the snapped volume.
File copy back	Individual files are copied back from the snapped volume to the current volume.

To determine if a volume can be rolled back, checks are made to insure that the same list of files exists in the following places:

- The snapshot volume is compared with the cataloged list of files to restore. These lists must match exactly. An example of a difference is a file that was included in the snapshot, but was not cataloged because it is not an Exchange file. The snapshot is not rolled back because that action overwrites the non-Exchange file. Exchange files also may exist on the snapshot but not in the catalog if the backup did not include all the databases on the volume.
- The snapshot volume is compared with the current volume. All files on the current volume must also exist in the snapshot. If there is a file that is not on the snapshot, a rollback is not performed because that action does not restore that file.

In both comparisons, NetBackup excludes certain files from consideration. For example, unneeded Exchange transaction logs, files Exchange re-generates, or any files that are artifacts of the NetBackup process. The `bppfi` log shows when such a file difference is found and excluded from consideration.

The copy-back restore method is used in the following situations:

- If the system provider is used and the snapshot selected for restore is not the most recent snapshot
- If there are other files on the volume that could be lost
- If all the files on the snapshot are not selected for restore
- If you select **Roll-Forward Recovery**. The copy-back method must be used for the volume that contains the log files. A roll-forward recovery needs the log files that were created since the backup. A rollback cannot be performed since it removes those log files. If the database file (`.edb`) is on a different volume,

that volume is still evaluated with the other criteria to determine if it is eligible for rollback.

If multiple volumes are included in the restore set, each volume is evaluated separately to determine if it is eligible for rollback. (The restore set is based on the location of the Exchange database, transaction logs, and system files that are part of the restore.) For example, perhaps the volume that contains the database files is eligible for rollback, but the volume that contains log files has extra, non-Exchange files. At the time of the restore, only the volume that contains the database files is rolled back. All the log files are copied back from the snapshot to the current volume.

See [“Configuring a snapshot policy for Exchange Server”](#) on page 115.

See [“About configuration requirements for the Exchange Server when you use Instant Recovery”](#) on page 127.

Policy recommendations for Exchange Instant Recovery

Create a policy with the following schedules when you use Instant Recovery:

- Create a snapshot policy with Instant Recovery enabled and with the option **Snapshots and copy snapshots to a storage unit** selected. (In [Table 5-18](#), see Schedules 1 and 2.)
- (Optional) For fast, temporary backups, create a separate policy with a **Full Backup** schedule. Enable **Retain snapshots for Instant Recovery or SLP management** and the Instant Recovery option **Snapshots only**. (In [Table 5-18](#), see Schedule 3.)

Information is available on how transaction logs are truncated according to the backup type you select.

See [“NetBackup for Exchange backup types”](#) on page 98.

Table 5-18 Instant recovery policy examples for Exchange Server

Policy type	Auto backup frequency	Copy to storage unit	Description and other configuration
MS-Exchange-Server	Schedule 1:Weekly Full	Yes	This schedule provides for disaster recovery .

Table 5-18 Instant recovery policy examples for Exchange Server *(continued)*

Policy type	Auto backup frequency	Copy to storage unit	Description and other configuration
	Schedule 2: Daily Incremental or Differential	Yes	<p>This schedule provides for disaster recovery .</p> <p>Note: Do not include cumulative and differential schedules in the same policy.</p> <p>Note: If you choose differential backups, you must choose Snapshots and copy snapshots to a storage unit.</p>
	Schedule 3: Every 4 hours	No	<p>This schedule provides fast, temporary backups because the snapshot is not copied to the storage unit. In the Snapshot Client group, click Options and set Maximum Snapshots to a small number.</p>

See [“About Exchange Instant Recovery methods”](#) on page 123.

See [“Limitations for Exchange Instant Recovery operations”](#) on page 126.

See [“About configuring Instant Recovery backups of Exchange Server”](#) on page 122.

Limitations for Exchange Instant Recovery operations

The following limitations exist for Instant Recovery operations:

- Instant recovery is only supported for Exchange 2007 and later.
- NetBackup can only restore an Instant Recovery backup that was performed with NetBackup 6.5.2 or later.
- Granular Recovery Technology (GRT) is only supported with Instant Recovery if you also configure a backup to a storage unit.

See [“About Exchange Instant Recovery methods”](#) on page 123.

See [“Configuring a snapshot policy for Exchange Server”](#) on page 115.

See [“About configuration requirements for the Exchange Server when you use Instant Recovery”](#) on page 127.

About Storage Foundations for Windows (SFW) and Exchange Instant Recovery

When you use the SFW VSS provider to create your Exchange IR snapshots, use Veritas Enterprise Administrator (VEA) rather than VShadow or Vssadmin to view and manage your snapshots. SFW resnaps a volume after a rollback restore,

but the Microsoft utilities are not aware of the new snapshot. They falsely report that the snapshot does not exist.

About configuration requirements for the Exchange Server when you use Instant Recovery

The following configuration is required for the Exchange Server when you use Instant Recovery:

- The volume(s) that contains the Exchange databases should be dedicated to Exchange only. Other types of databases (for example, SQL Server) should not reside on the volume(s). Only Exchange objects are included in a snapshot backup.
- To allow volume rollback to occur during a restore, a volume should contain the database files for only one database.
- Transaction logs or Exchange system files should **not** reside on the same volume as the Exchange database file (.edb).
- (Exchange 2007) Restore all databases in a storage group at the same time. Also restore the all the databases before the transaction logs are committed and the databases are mounted. Transaction logs are committed at a storage group level, rather than at a database level.

About Exchange Instant Recovery with the Microsoft VSS Provider

A special requirement exists when you want to use Instant Recovery with the Microsoft VSS Provider. Symantec recommends when you create a policy for an Exchange 2010 standalone server that you include only the databases that are on a common volume. For Exchange 2007, include only the storage groups whose databases are on a common volume.

If an IR policy backs up databases on multiple volumes and you restore a subset of those volumes, NetBackup deletes the other snapshots. Otherwise the backup image contains an incomplete snapshot set. A rollback with the Microsoft VSS Provider consumes the snapshot because it does not provide for re-snapping the volume.

If you use Instant Recovery with the Microsoft VSS Provider and you select any items that span multiple volumes, the following occurs:

- NetBackup creates a backup set with one snapshot for each volume.
- During restores, if any snapshots are rolled back, all of the snapshots in that set are deleted. (With the SFW VSS provider or the hardware system provider,

the rolled back snapshots are re-snapped so that the snapshot set remains complete.)

This situation is a limitation of the Microsoft VSS Provider. It typically occurs when you do a roll-forward restore of a database and log folders that are on separate volumes (Exchange 2010). Or when you do a roll-forward restore of a storage group whose database and log folders are on separate volumes (Exchange 2007). The database volume normally is rolled back but the log volume is copied back. This action preserves the logs that were created since the backup. NetBackup then deletes the log snapshot and removes the IR copy of the backup image from the catalog. If a storage unit copy of the backup exists, it remains.

Configuring an Exchange snapshot policy with Instant Recovery

This topic describes how to configure a snapshot policy with Instant Recovery. This topic only covers what is necessary to configure Instant Recovery snapshot backups of Exchange Server. Information on how to configure other policy information is described in other topics. (This information includes other policy attributes and how to create schedules, add clients, and add backup selections.)

See [“Adding schedules for Exchange Instant Recovery”](#) on page 130.

See [“Adding clients to a NetBackup for Exchange policy”](#) on page 100.

See [“Adding backup selections to an Exchange policy with Instant Recovery”](#) on page 133.

If you have existing streaming backup policies and you upgraded to an Exchange 2010 standalone server, you must update your backup policies. Exchange 2010 backup policies require that **Perform snapshot backups** is enabled. You may have to update the backup selections list with the correct directives.

Optionally you can perform an off-host Instant Recovery backup.

To configure a snapshot policy with Instant Recovery for Exchange Server

- 1 Create a new policy.
- 2 Click the **Attributes** tab.
- 3 In the **Policy type** drop-down list, click **MS-Exchange-Server**
- 4 Select the **Policy storage**.

See [“Adding schedules for Exchange Instant Recovery”](#) on page 130.

- 5 Click **Perform snapshot backups**.

6 Click Retain snapshots for Instant Recovery or SLP management.

NetBackup retains the snapshot on disk, so that Instant Recovery can be performed from the snapshot. A normal backup to storage is also performed when the backup schedule specifies **Snapshot and copy to storage unit**.

See [“Adding schedules for Exchange Instant Recovery”](#) on page 130.

See [“Schedules settings in Exchange Instant Recovery policies”](#) on page 131.

Change Policy - policy

Attributes | Schedules | Clients | Backup Selections

Machine:

Microsoft Exchange Attributes

Exchange 2010 DAG or Exchange 2007 replication (LCR or CCR)

Database backup source:

Preferred server list... (Exchange 2010 DAG only)

OK Cancel Help

7 In the Snapshot Client group, click Options.

8 In the Snapshot Client Options dialog box, from the Snapshot method list click VSS.

9 Adjust the configuration parameters.

See [“Snapshot options for backups of Exchange Server”](#) on page 118.

- 10 Optional: If you selected that you want to divide backups into multiple jobs and you selected **Snapshot and copy to storage unit**, click **Allow multiple data streams**.

See [“Performing Exchange backups with multiple data streams”](#) on page 103.

- 11 (Optional) To perform off-host Instant Recovery backups do the following:

- Click **Perform off-host backup**.
- In the **Use** box, select **Alternate Client**.
- In the **Machine** box, type the name of the alternate client.

If you use the SFW VSS provider, review the additional installation requirements and configuration that exist.

See [“Requirements for Exchange off-host backups”](#) on page 28.

- 12 Add other policy information as follows:

- Add clients to the policy.
See [“Adding clients to a NetBackup for Exchange policy”](#) on page 100.
- Add backup selections to the policy.
See [“Notes and limitations for creating a backup selections list for Exchange 2007 streaming database backups”](#) on page 135.
See [“Adding backup selections to an Exchange policy with Instant Recovery”](#) on page 133.

- 13 After you add all the clients, schedules, and backup selections you need, click **OK**.

See [“Policy recommendations for Exchange Instant Recovery”](#) on page 125.

Adding schedules for Exchange Instant Recovery

Follow these instructions to configure schedules for an Instant Recovery policy.

To add schedules for Instant Recovery

- 1 In the **Policy** dialog box, click the **Schedules** tab.
- 2 Click **New**.
- 3 In the **Schedules** dialog box, create at least one **Full** type of schedule.
- 4 From the **Instant Recovery** group, select one of the following options.

Snapshots and copy snapshots to a storage unit

This option is required for the following:

- Differential backups
- Disaster recovery scenarios where both the primary and the snapshot volume have been damaged
- Instant Recovery backups with **Enable granular recovery** enabled

Snapshots only

For fast, temporary backups.

5 Click **OK**.

6 To close the dialog box, click **OK**.

See [“About configuring snapshot backups of Exchange Server”](#) on page 110.

See [“Configuring a snapshot policy for Exchange Server”](#) on page 115.

See [“Configuring an Exchange snapshot policy with Instant Recovery”](#) on page 128.

Schedules settings in Exchange Instant Recovery policies

Note the following settings in the **Schedules** tab when you add a schedule for a policy with Instant Recovery.

Table 5-19 Settings for schedules in Instant Recovery policies

Setting	Options	Description
Type of Backup	Full or user	Snaps the volumes that contain the Exchange database, system, and log files.
	Differential or cumulative incremental	<p>Snaps the volumes that contain the Exchange system and log files. Differential backups require that the transaction logs are backed up to a storage unit and kept on the Instant Recovery snapshot volume. (Select the Snapshots and copy snapshots to a storage unit option.)</p> <p>This configuration is required because all of the differential backups after the last full backup are required to fully restore a database. Since a differential backup truncates the transaction logs, there is no way to guarantee that all of the log files exist. Also, snapshot rotation might have snapped back or deleted one or more snapshot images. They must be backed up to a storage unit.</p>

Table 5-19 Settings for schedules in Instant Recovery policies (*continued*)

Setting	Options	Description
Retention	One week - infinity	<p>The retention level indicates the maximum time that the Instant Recovery snapshot is retained. For full backups, select a retention level that ensures a full backup is always available for restore. The snapshot can be deleted before that time if the snapshot volume is required for another backup attempt.</p> <p>See “About Exchange Instant Recovery volume rotation” on page 132.</p>
Instant Recovery	Snapshots and copy snapshots to a storage unit	<p>Note: The Instant Recovery options are available if you select Retain snapshots for Instant Recovery or SLP management (on the Attributes tab of the policy).</p> <p>NetBackup creates a disk snapshot and backs up the client’s data to the storage unit that is specified for the policy. This option is required if you want to perform Instant Recovery backups with Granular Recovery Technology (GRT).</p> <p>Transaction logs are deleted when the backup (full or differential) to the storage unit has completed.</p>
	Snapshots only	<p>The image is not backed up to tape or to other storage. NetBackup creates a persistent snapshot only. Note that this persistent snapshot is not considered a replacement for traditional backup.</p> <p>Transaction logs are not deleted for this schedule option. To delete transaction logs, you must perform a backup to a storage unit. Alternatively, you can configure NetBackup to delete logs for any full Instant Recovery backups that are snapshot only.</p> <p>See “About truncating Exchange transaction logs with Instant Recovery backups” on page 38.</p>

See [“Snapshot options for backups of Exchange Server”](#) on page 118.

About Exchange Instant Recovery volume rotation

At the start of a backup, the Snapshot Client is queried to determine how many Instant Recovery snapshots currently exist for each volume. This information is required for the Exchange storage groups that are selected for backup. If the number of snapshots is currently at the configured maximum level of snapshots, a snapshot is resynced (or snapped backup or deleted). Then a snapshot is available for the upcoming backup attempt.

The algorithm to determine which snapshot volume is resynced considers whether the snapshot was taken as part of a full backup or an incremental backup. The

algorithm tries to maintain as many full backups as possible, even if newer incremental backups have to be resynced.

See [“Snapshot options for backups of Exchange Server”](#) on page 118.

See [“About consistency checks options for an Exchange 2010 or later backup”](#) on page 39.

See [“About snapshot backups with Exchange Server”](#) on page 112.

Adding backup selections to an Exchange policy with Instant Recovery

You can include each Exchange storage group in one backup policy. Or you can choose to include a storage group in more than one policy. In the latter case, ensure that enough snapshot volumes exist to satisfy the **Maximum Snapshots** value for each policy that contains the storage group.

When you configure an Exchange snapshot backup policy, the only valid directives are: `Microsoft Exchange Database Availability Groups:\` or `Microsoft Information Store:\` (a database or storage group can be appended) .

Note: To back up individual databases, you must select all the databases in the storage group.

See [“Policy recommendations for Exchange Instant Recovery”](#) on page 125.

See [“Configuration requirements and recommendations for the Exchange Server when performing snapshot operations”](#) on page 113.

See [“About Exchange Instant Recovery methods”](#) on page 123.

Configuring streaming backups of Exchange Server (Exchange 2007)

Streaming backups can only be performed with Exchange 2007. NetBackup uses snapshot technology for all Exchange 2010 backups.

To configure a streaming NetBackup for Exchange policy (Exchange 2007)

- 1 Review the notes and limitations for this type of backup.
 See [“Notes and limitations for creating a backup selections list for Exchange 2007 streaming database backups”](#) on page 135.
- 2 Log on to the master server as administrator (Windows) or root (UNIX).
- 3 Start the NetBackup Administration Console.

- 4 If your site has more than one master server, choose the one on which you want to add the policy.
- 5 In the NetBackup Administration Console, select **NetBackup Management > Policies**. Then select **Actions > New > New Policy**.
- 6 In the **Add a New Policy** dialog box, in the **Policy name** box, type a unique name for the new policy.
- 7 Click **OK**.
- 8 In the **Add New Policy** dialog box, in the **Policy type** list, select **MS-Exchange-Server**.

The database agent policy type does not appear in the drop-down list unless your master server has a license key for the database agent.

- 9 (Optional) To enable restores of individual items from database backups, click **Enable granular recovery**.

See [“Configuring an Exchange backup that uses Granular Recovery Technology \(GRT\) \(non-VMware backups\)”](#) on page 56.

- 10 Complete the entries on the **Attributes** tab.
 See [“About policy attributes for NetBackup for Exchange”](#) on page 95.
- 11 Add other policy information as follows:
 - Add schedules.
 See [“Adding schedules to a NetBackup for Exchange policy”](#) on page 97.
 - Add clients.
 See [“Adding clients to a NetBackup for Exchange policy”](#) on page 100.
 - Add database objects to the backup selections list.
 See [“Adding backup selections to an Exchange policy”](#) on page 101.
 See [“Notes and limitations for creating a backup selections list for Exchange 2007 streaming database backups”](#) on page 135.
- 12 For any backups that use Granular Recovery Technology (GRT), configure the list of Exchange hosts.
 See [“Configuring the Exchange hosts for a backup that uses Granular Recovery Technology \(GRT\)”](#) on page 79.
- 13 When you have added all the schedules, clients, and backup selections you need, click **OK**.

Notes and limitations for creating a backup selections list for Exchange 2007 streaming database backups

Streaming backups include the `Microsoft Information Store:\` directive.

Review the following information before you create a backup selections list for the Exchange 2007 streaming database backups:

- NetBackup for Exchange does not support incremental backups of individual databases within a storage group.
- When individual databases in a storage group are backed up, the transaction logs for the entire storage group are also included in the backup.
 Transaction logs are not truncated (deleted) until a full backup is run on every database in the storage group. To ensure that transaction logs are truncated (deleted) regularly, include all databases for a storage group in a full backup policy. Or specify the storage group (not individual databases) in the backup policy.

Performing a manual backup for an MS-Exchange-Server policy

After you configure the servers and clients in your environment, you can test the configuration settings with a manual backup. Perform a manual backup (or backups) with the automatic backup schedules you created. A description of status codes and other troubleshooting information is available.

See the *NetBackup Status Codes Reference Guide*.

See the *NetBackup Troubleshooting Guide*.

Note: A manual backup creates a real backup. Exchange logs are truncated, if appropriate.

To perform a manual backup

- 1 Log onto the master server as administrator (Windows) or root (UNIX).
- 2 Start the NetBackup Administration Console.
- 3 In the left pane, click **Policies**.
- 4 Click the policy you want to test.
- 5 Select **Actions > Manual Backup**.

The **Schedules** pane contains the name of an automatic schedule (or schedules) configured for the policy that you want to test. The **Clients** pane contains the name of the client(s) listed in the policy that you want to test.
- 6 Follow the directions in the **Manual Backup** dialog box.
- 7 To check the status of the backup, click **Activity Monitor** in the NetBackup Administration Console.

Performing backups and restores of Exchange Server, mailboxes, and public folders

This chapter includes the following topics:

- [About user-directed backups of Exchange Server data](#)
- [About selecting a source client for an Exchange Server backup operation](#)
- [Options for user-directed Exchange backups](#)
- [Performing user-directed snapshot backups of Exchange Server](#)
- [Performing user-directed streaming backups of Exchange Server \(Exchange 2007\)](#)
- [Performing user-directed full streaming backups \(Exchange 2007\)](#)

About user-directed backups of Exchange Server data

With NetBackup for Exchange you can perform user-directed snapshot and streaming database backups. With Exchange 2007 streaming backups you can also perform user-directed full streaming backups.

See [“Performing user-directed snapshot backups of Exchange Server”](#) on page 139.

See [“Performing user-directed streaming backups of Exchange Server \(Exchange 2007\)”](#) on page 141.

See [“Performing user-directed full streaming backups \(Exchange 2007\)”](#) on page 142.

Additionally you can use NetBackup for Exchange to perform user-directed mailbox and public folder backups.

See [“About Exchange mailbox and public folder operations with MAPI”](#) on page 234.

About selecting a source client for an Exchange Server backup operation

When you back up from a standalone server or non-virtual environment, you do not need to select or add a particular source client. However, to perform an Exchange backup in a cluster or DAG environment, you select the virtual client name as the source client. NetBackup requires this configuration for backups of clusters to be successful.

Note: Note that you cannot use the Java client interface to select a virtual client or virtual DAG name for a backup operation. Instead, log on with the virtual client name or virtual DAG name.

To select a source client for an Exchange Server backup operation

- 1 In the NetBackup Backup, Archive, and Restore interface, select **File > Specify NetBackup Machines and Policy Type**.
- 2 Select the source client as described in [Table 6-1](#).

Table 6-1 Source client for an Exchange Server backup operation

To perform a backup of	For Source client for restores (or virtual client for backups), select
An Exchange DAG	the DAG name. If necessary, add the virtual name to the list and then select it.
An Exchange 2007 cluster	the virtual Exchange Server name. If necessary, add the virtual name to the list and then select it.

Options for user-directed Exchange backups

Table 6-2 Backup options

Option	Description
NetBackup server	To change the NetBackup server that you want to perform the backup operation, select another server from the drop-down list.
Items marked to be backed up	Contains a list of objects to be backed up.
Keyword phrase to associate with the backup or archive	Specifies a keyword phrase, up to 128 characters in length, that NetBackup associates with the image created by this backup operation. You then can restore the image by specifying the keyword phrase in the Search Backups dialog box. All printable characters are permitted including space (" ") and period ("."). The default keyword phrase is the null (empty) string.
Start Backup	Initiates the backup operation.

Performing user-directed snapshot backups of Exchange Server

To perform a user-directed snapshot backup, a policy must exist on the server that is configured for snapshot backups. This policy must also have a User schedule. Exchange 2010 users can back up a DAG, the Information Store, or a database. Exchange 2007 users can back up the Information Store or a storage group. Transaction logs are also backed up. However, transaction logs are not truncated for user-directed backups.

When **Enable granular recovery** is enabled in the backup policy, you can later restore individual mailbox and public folder items from the backup.

To perform a user-directed snapshot backup of Exchange Server objects

- 1 Mount any databases that you want to back up.
- 2 Open the Backup, Archive, and Restore interface.

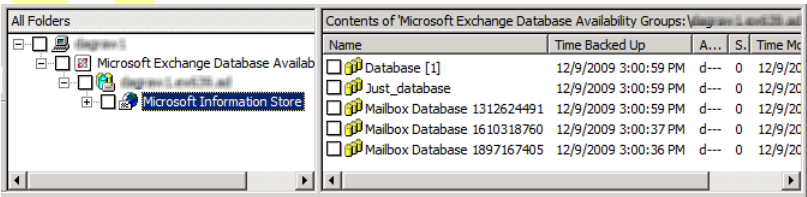

For a Database Availability Group (DAG), you must initiate the user backup operation from the node where the DAG virtual name is active (online).
- 3 Click **Actions > Specify Policy and Schedule**.
- 4 In the **Backup Policy and Schedule** box, type the name of the Snapshot Client policy.

- 5 Click **File > Select Files and Folders to Back Up**.
- 6 Select **File > Specify NetBackup Machines and Policy Type**.
- 7 In the **Specify NetBackup Machines and Policy Type** dialog box, provide the following information:
 - The server you want to perform the backup.
 - If you are in a cluster environment, specify the name of the virtual Exchange Server or the DAG virtual name.
See “[About selecting a source client for an Exchange Server backup operation](#)” on page 138.
- 8 In the **All Folders** pane, select the objects you want to back up.
See [Table 6-3](#) on page 141.

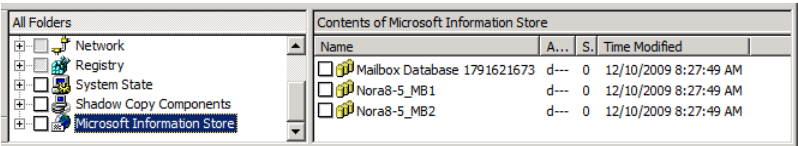

Note the following:

- For an Exchange 2010 Database Availability Group (DAG), you cannot select a specific server in the **Backup**, **Archive**, and **Restore** interface from which to perform the backup. If you want to use a specific server, specify it in the **Preferred server list**.
See “[Backup source for an Exchange 2010 DAG backup or an Exchange 2007 replication backup](#)” on page 119.
All databases in the DAG, regardless of what server they reside on, are displayed.
- For Exchange 2007 backups of individual storage group databases, you must select all the databases in the storage group. If you do not select all the databases, the backup job fails.

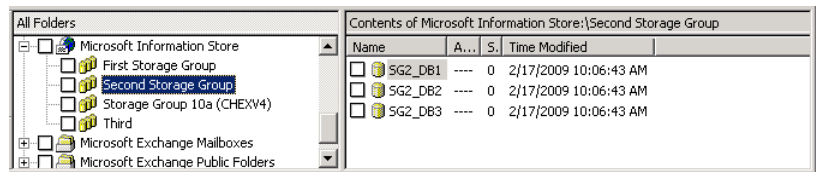

The following figure shows a backup of an Exchange 2010 DAG.

The following figure shows a backup of an Exchange 2010 standalone server.

The following figure shows a backup of an Exchange 2007 storage group.

- 9 Click **Actions > Backup**.
- 10 In the **Backup Files** dialog box, click **Start Backup**.
- 11 To view the progress of the backup, click **Yes**.

If you do not want to view the progress of the backup, click **No**.

Table 6-3 Selecting Exchange database objects for user-directed backups

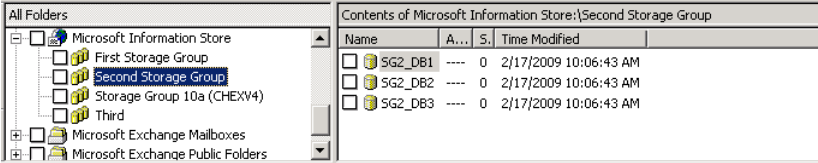

Exchange version	Note	Objects to back up
Exchange 2010 DAG	Microsoft Exchange Database Availability Groups	DAG All databases in the DAG
Exchange 2010 standalone server	Microsoft Information Store	Microsoft Information Store All databases
Exchange 2007	Microsoft Information Store	Microsoft Information Store Storage groups All databases

Performing user-directed streaming backups of Exchange Server (Exchange 2007)

To perform a user-directed backup, the backup policy must have a User schedule. Users can back up the Information Store, storage groups, and individual databases. When **Enable granular recovery** is enabled in the backup policy, you can later restore individual mailbox items from the backup.

To perform a user-directed backup

- 1 Log onto the server as Administrator.
- 2 Ensure all databases that you want to back up are mounted and online.
- 3 Open the Backup, Archive, and Restore interface.

- 4 Click **File > Select Files and Folders to Back Up**.
 - 5 Select **File > Specify NetBackup Machines and Policy Type**.
 - 6 In the **Specify NetBackup Machines and Policy Type** dialog box, provide the following information:
 - The server you want to perform the backup.
 - If you are in a cluster environment, specify the name of the virtual Exchange Server name.
 See [“About selecting a source client for an Exchange Server backup operation”](#) on page 138.
 - 7 In the **All Folders** pane, click the objects you want to back up, as follows:
 - Storage groups. Expand the Microsoft Information Store node and select the storage group to back up.
 - Individual databases. To back up an individual database within a specific storage group, expand the Microsoft Information Store. Then expand the storage group and select the database to back up.
- 
- The screenshot shows the NetBackup console interface. On the left, the 'All Folders' pane is expanded to show the 'Microsoft Information Store' node, which contains several storage groups: 'First Storage Group', 'Second Storage Group' (highlighted), 'Storage Group 10a (CHEXV4)', and 'Third'. Below these are 'Microsoft Exchange Mailboxes' and 'Microsoft Exchange Public Folders'. On the right, the 'Contents of Microsoft Information Store: \Second Storage Group' pane displays a table of databases:
- | Name | A... | S... | Time Modified |
|---------|------|------|-----------------------|
| SG2_DB1 | ---- | 0 | 2/17/2009 10:06:43 AM |
| SG2_DB2 | ---- | 0 | 2/17/2009 10:06:43 AM |
| SG2_DB3 | ---- | 0 | 2/17/2009 10:06:43 AM |
- 8 Click **Actions > Backup**.
 - 9 Select the backup options you want.
 See [“Options for user-directed Exchange backups”](#) on page 139.
 - 10 Click **Start Backup**.
 - 11 To view the progress of the backup, click **Yes**.

Performing user-directed full streaming backups (Exchange 2007)

In NetBackup, a user-directed backup of Exchange acts as a copy backup. Copy backups are the same as full backups, except copy backups do not truncate the Exchange log files. You can change the behavior of a user backup so that it normally acts as a full backup instead of a copy backup. As with regular full backups, the logs are truncated.

Note: This configuration is only available for streaming backups.

To perform a user-directed copy backup

- 1 Log onto the server as Administrator.
- 2 From the Backup, Archive, and Restore interface, perform a user-directed streaming backup.

See [“Performing user-directed streaming backups of Exchange Server \(Exchange 2007\)”](#) on page 141.

To configure user-directed backups to act as full backups

- 1 On the Exchange client, open Regedit.
- 2 Open the following key:

HKEY_LOCAL_MACHINE\SOFTWARE\VERITAS\NetBackup\CurrentVersion\Agents\Exchange

- 3 Create a new DWORD value named **Convert_USER_to_FULL**.
- 4 Right-click on the new value and click **Modify**.
- 5 In the **Value data** box, type **1**.
- 6 Click **OK**.
- 7 Repeat these steps for any other Exchange clients.

DRAFT

Performing restores of Exchange Server, mailboxes, and public folders

This chapter includes the following topics:

- [About Exchange server-directed and redirected restores](#)
- [About selecting a destination client for an Exchange Server restore operation](#)
- [About restoring Exchange database data](#)
- [About existing Exchange Server transaction logs](#)
- [About restoring Exchange snapshot backups](#)
- [About restoring streaming backups of Exchange Server \(Exchange 2007 and earlier\)](#)
- [About restoring individual Exchange mailbox and public folder items](#)
- [About restoring Backup Exec Exchange images with NetBackup](#)

About Exchange server-directed and redirected restores

With the Backup, Archive, and Restore interface, the administrator can browse for Exchange Server backups and select the ones to restore. The following types restores are available:

- Server-directed
- Redirected restores to a different client
- Redirected restores to a different target or database location

With a server-directed restore, an administrator can browse Exchange Server databases and select the ones you want to restore. NetBackup lets you select the NetBackup server from which files are restored, view the backup history, and select items to restore. You can select a specific client or other clients that were backed up by the selected NetBackup server.

When you redirect to a different client, you can restore to an Exchange client other than the one that was originally backed up. You can redirect the Exchange databases, directories, or mailbox objects. The administrator can direct restores to any NetBackup for Exchange client (regardless of which client performed the backup). To redirect a restore, the administrator can use the NetBackup Administration Console on the master server or the Remote Administration Console.

See the *NetBackup Administrator's Guide* for the configuration that is needed for this type of redirected restore.

A redirected restore to a different target or database location allows a user to restore mailbox or public folder objects to a target or a database location different from the location from which the objects were backed up. Depending on the Exchange version and type of backup, database objects can be redirected to the following:

- The Exchange recovery database (RDB)
- The Exchange recovery storage group (RSG)
- Another database
- Another storage group

About selecting a destination client for an Exchange Server restore operation

If you want to perform a restore to the original client that performed the backup, you do not need to change the destination client. However, it may not be possible to restore an Exchange database from a NetBackup client-only installation on a cluster. You may not be able to change the destination client value to match the virtual server name. In that case, use the Backup, Archive, and Restore interface on a NetBackup server. From the server you can change the destination client value to the virtual server name.

When you perform a restore of an Exchange backup, you can choose a different destination client to which you want to restore a backup. (This type of operation is called redirecting a restore to a different client.) Most of the Exchange objects that are backed up can be redirected to a different client. The Microsoft Exchange Information Store databases can be restored to a different Exchange server.

The following requirements must be met before you redirect the restore of databases, storage groups, or storage group databases:

- You must have NetBackup server privileges or be logged into a server with the NetBackup Administration Console or the NetBackup Remote Administration Console.
- The databases or the storage groups must exist on the target server.
- (Exchange 2007 and earlier) The storage group databases must have the same names as those in the original storage group.
- (Exchange 2007 and earlier streaming backups) The target server must have the same Organization and Administrative Group name as the source server.

The following additional limitations apply for Exchange 2003 when you redirect a snapshot restore to a different client:

- The storage group log prefix on the target server must be the same as the prefix of the original storage group. (For example, E00.log.) You may need to create temporary storage groups so that the target storage group has the same log prefix as the original.
- The target storage group and databases must have the same path as the original storage group and databases for the following: Exchange database, transaction logs, and system files.

To select a destination client for an Exchange Server restore operation

- 1 In the NetBackup Backup, Archive, and Restore interface, select **File > Specify NetBackup Machines and Policy Type**.
- 2 Select the destination client as described for the specific restore you want to perform:

See [“Redirecting an Exchange 2010 Database Availability Group \(DAG\) snapshot backup to another database or to the recovery database \(RDB\)”](#) on page 158.

See [“Redirecting an Exchange 2010 or later standalone server snapshot backup to another database or to the recovery database \(RDB\)”](#) on page 162.

See [“Redirecting an Exchange 2007 snapshot backup to a storage group”](#) on page 167.

See [“About redirecting restores of Exchange 2003 snapshot backup images”](#) on page 173.

See [“Redirecting an Exchange 2007 or Exchange 2003 streaming backup to a recovery storage group”](#) on page 177.

About restoring Exchange database data

Review the following information before you perform restores of Exchange Server:

- Restore all databases in a storage group at the same time and before the transaction logs are committed and the databases are mounted.
- When an administrator restores individual databases or transaction logs, the administrator should have a thorough working knowledge of Exchange Server databases, transaction logs, and utilities. If the correct files are not restored, the database(s) may fail to mount.
- Do not restore Microsoft Exchange Mailboxes:\ or Microsoft Exchange Public Folders:\ objects and Microsoft Information Store:\ objects at the same time. Do not restore mailbox or public folder items from a GRT-enabled backup and a streaming backup at the same time. You must dismount databases before you restore them. But because they are dismounted, the attempt to restore mailbox objects fails. Or the restore of the Exchange mailbox items can finish before the restore of the Exchange databases starts. In this case the restore of the Exchange databases overwrites the restored mailbox objects.
- To restore full and incremental backups, you can restore backups in one of the following ways:

- **Restore all the backups in a single operation**
 The backup images must be of the same type. For example, you must restore snapshot and streaming images in separate restore jobs. You can, however, restore a full VMware backup and a differential snapshot in a single restore job.
 When you restore all the backups in a single operation, NetBackup performs a commit after the last incremental is restored.
- **Restore the full backups and incremental backups individually**
 When you restore the backups individually, deselect **Commit after last backup set is restored** for the full backup and all but the *last* incremental backup set. Select the following options when you restore the *last* incremental backup set: **Commit after last backup set is restored** and **Mount database after restore**.
- (Exchange 2007 and earlier streaming restores) Make sure the temporary location for log files is empty before you start a restore job. If a restore job fails, check the temporary location (including subdirectories) to make sure log files from a previous restore job are deleted.
 NetBackup copies logs to the Exchange working directory. It creates a subdirectory for each storage group being restored. After the database is restored, Exchange applies the log files from the temporary location to the database, and then it applies the current log files. After the recovery is complete, Exchange deletes the log files from the temporary location (including any subdirectories).
- A restore of Exchange Server files always overwrites existing files. (For example, if `Pub.edb` already exists on the target machine, it is replaced with the copy from the backup.)
- Review the information for existing transaction logs.
 See [“About existing Exchange Server transaction logs”](#) on page 149.

About existing Exchange Server transaction logs

Depending upon the data recovery scenario you have, you must take existing transaction logs into consideration.

For example, do one of the following tasks:

- **Roll-forward recovery (or replay all log files)**
 After you restore the files and the service starts up, Exchange commits the transactions in the logs you restored. If contiguous logs exist on the server beyond the log with the highest number you restored, those transactions also

are committed. If there is any gap in the numeric sequence of log names, no further transactions are committed beyond the gap.

This scenario is useful when the transaction logs are intact but you require the database to be restored. When you keep existing transaction logs, Exchange Server can recover to the point of the failure. Otherwise, you must recover to the time of the last full backup or the last incremental backup.

- **Point-in-time recovery (or replay only restored log files)**
Use this option if you only want to restore up to the point of the last backup. Any transaction logs that are created after the last backup are not involved in the recovery of the database(s). For snapshot restores, NetBackup renames current log files to `.delete`.

About restoring Exchange snapshot backups

From a snapshot backup you can restore the Microsoft Information Store, Exchange 2010 databases, and Exchange 2007 and earlier storage groups and storage group databases. If you enabled Granular Recovery Technology (GRT) for the backup, you can also restore mailbox and public folder items from the backup.

See [“About restoring individual Exchange mailbox and public folder items”](#) on page 180.

Note the following when you restore snapshot backups:

- (Exchange 2007 and earlier) All databases in a storage group must be dismounted before you begin a restore operation. You can instruct NetBackup to dismount the databases before the restore begins.

See [“Options for Exchange snapshot restores”](#) on page 151.

- All of the images you select for the restore must be from snapshot backups.
- Only Exchange 2007 allows snapshot restores to the recovery storage group (RSG).
- Exchange 2010 allows a restore to the recovery database (RDB).
- *Reviewer: Issue reported by Aaron , added 10/8/12*
To successfully redirect to the RSG, in Exchange you must configure the same path for the **Transaction log file folder** and the **System folder and checkpoint file folder**. For an existing RSG, remove the RSG and recreate it.

- (Exchange 2007 and later) For Instant Recovery restores:
Select **Normal Backup** even if you want to perform volume rollback. NetBackup automatically rolls back volumes whenever it is appropriate

One of the following occurs:

- NetBackup snaps back (resyncs) the selected database volumes from the snapshot to the original volume.
- NetBackup copies back the files of the selected databases from the snapped volume to the original volume

Options for Exchange snapshot restores

The following restore options are available when you perform snapshot restores.

Table 7-1 Snapshot restore options

Option	Description
Roll-Forward Recovery (Replay all log files)	Retains the existing transaction logs. Exchange replays transaction logs that are part of the restore operation, followed by any transaction logs that currently exist. See “ About existing Exchange Server transaction logs ” on page 149.
Point-in-Time Recovery (Replay only restored log files)	Restores the database(s) or storage group(s) and replaces only the transaction logs that existed at the time of backup. A restore may require a full backup and one or more incremental backups. You can select all of the images and perform the restore in one job. Or you can restore each backup image separately. In the latter case, only enable Point-in-Time Recovery for the first job. Otherwise, each point-in-time recovery deletes the transaction logs from the preceding restore jobs. NetBackup renames all transaction log files that exist at the start of the recovery operation to EXXXXXXXXX.log.delete or E0yXXXXX.log.delete. Current transaction logs are only renamed for the Exchange database or storage group that is restored. Then NetBackup copies logs from the backup image. You can manually delete any logs named E*.log.delete when the restore or recovery is successful. Otherwise, NetBackup deletes them on the next point-in-time recovery.
Temporary location for log files	Not applicable for snapshot restores.
Dismount database prior to restore	Dismounts the database(s) before the restore begins. For Exchange 2007 and earlier, this option dismounts all of the databases in the storage that you want to restore, even if a database is not selected for restore. By default this option is not selected. This option also sets the Database can be overwritten by a restore flag in Exchange 2007 and later. Note: Use this option with caution. Ensure that you selected the correct database to restore before you choose to dismount it with this option.

Table 7-1 Snapshot restore options (*continued*)

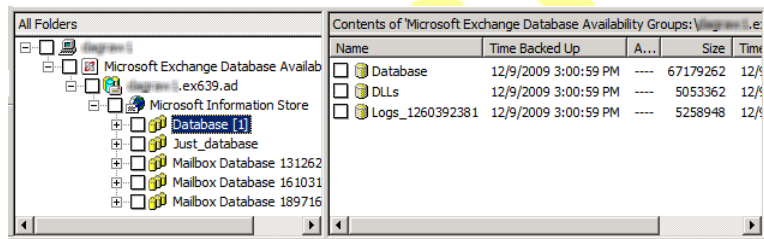

Option	Description
Commit after last backup set is restored	<p>This option should only be set on the last job of a multi-job restore. This option enables the restore operation to play through log files and roll back any uncompleted transactions. If this option is not selected, the database needs to be mounted manually after the restore.</p> <p>If Commit after last backup set is restored is selected when an intermediate backup is applied, you cannot restore further backups. You must restart the restore operation from the beginning.</p>
Mount database after restore	Mount database after restore is automatically selected if Commit after last backup set is restored is selected. Otherwise, this option is disabled.
Redirect to Recovery Storage Group (RSG) (Only for Exchange 2007)	<p>Check this option to restore to the recovery storage group (RSG, only applies to Exchange 2007 restores). You cannot restore Exchange 2003 VSS backups to the recovery storage group.</p> <p>See “Redirecting an Exchange 2007 snapshot backup to the recovery storage group” on page 170.</p>
Start Restore	Initiates the restore operation.

Performing a snapshot restore of a Database Availability Group (DAG)

To perform a snapshot restore of a Database Availability Group (DAG)

- 1 Manually suspend replication. This step applies for any snapshot provider you use.
<http://technet.microsoft.com/en-us/library/dd298159.aspx>
- 2 Dismount all Exchange databases that you want to restore.
 Or, when you perform the restore, click the **Dismount database prior to restore** option.
- 3 Open the Backup, Archive, and Restore interface.
- 4 Click **File > Select Files and Folders to Restore > from Normal Backup**.
- 5 Select **File > Specify NetBackup Machines and Policy Type**.
- 6 In the **Specify NetBackup Machines and Policy Type** dialog box, provide the following information:
 - The server that performed the restore.
 - For the source client, select the DAG virtual name.
 See [“About selecting a source client for an Exchange Server backup operation”](#) on page 138.

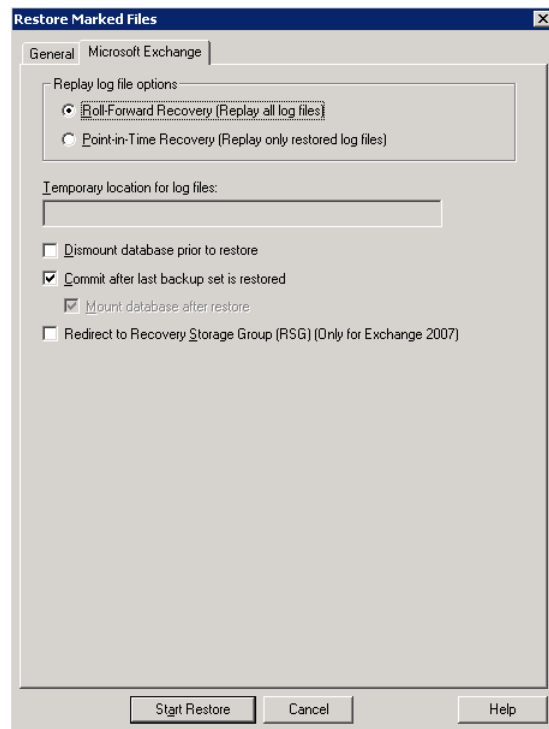

- For the policy type, select **MS-Exchange-Server**.
- 7 From the **NetBackup History** pane, click the backup image that contains the objects you want to restore as follows:
- The last full backup or user-directed backup
 - The last full backup and all subsequent differential backups
 - The last full backup and the last cumulative backup
- 8 In the **All Folders** pane, select the objects you want to restore, as follows:
- The Database Availability Group.
Selecting this object restores all the databases.
 - Databases.
Expand the DAG. Then select the database(s) and log files you want to restore.

- 9 Click **Actions > Restore**.

10 Click the **Microsoft Exchange** tab.

See “Options for Exchange snapshot restores” on page 151.

11 Click **Start Restore**.

The restore is directed to the active Exchange database, regardless of which database was backed up. NetBackup automatically detects the Exchange server that currently contains the active Exchange database.

12 When the restore completes, resume replication.

13 If necessary, update the mailbox database copy.

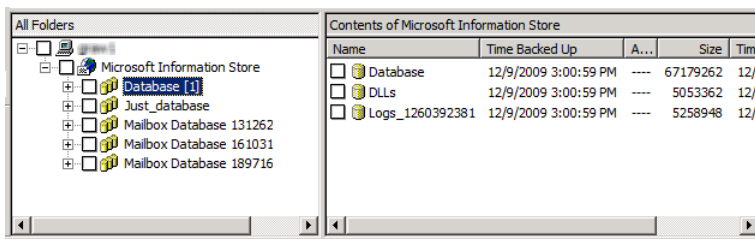

<http://technet.microsoft.com/en-us/library/dd351100.aspx>

Performing a snapshot restore of an Exchange 2010 standalone server

To perform a snapshot restore of an Exchange 2010 standalone server

- 1 Dismount all Exchange databases that you want to restore.
 Or, when you perform the restore, click the **Dismount database prior to restore** option.
- 2 Open the Backup, Archive, and Restore interface.
- 3 Click **File > Select Files and Folders to Restore > from Normal Backup**.
- 4 Select **File > Specify NetBackup Machines and Policy Type**.
- 5 In the **Specify NetBackup Machines and Policy Type** dialog box, provide the following information:
 - The server that performed the restore.
 - For the policy type, select **MS-Exchange-Server**.
- 6 From the **NetBackup History** pane, click the backup image that contains the objects you want to restore as follows:
 - The last full backup or user-directed backup
 - The last full backup and all subsequent differential backups
 - The last full backup and the last cumulative backup
- 7 In the **All Folders** pane, select the objects you want to restore, as follows:
 - The Microsoft Information Store.
 Click the checkbox next to the computer name or the **Microsoft Information Store**.
 - Databases.
 Expand the **Microsoft Information Store** node. Then select the database(s) and log files you want to restore.

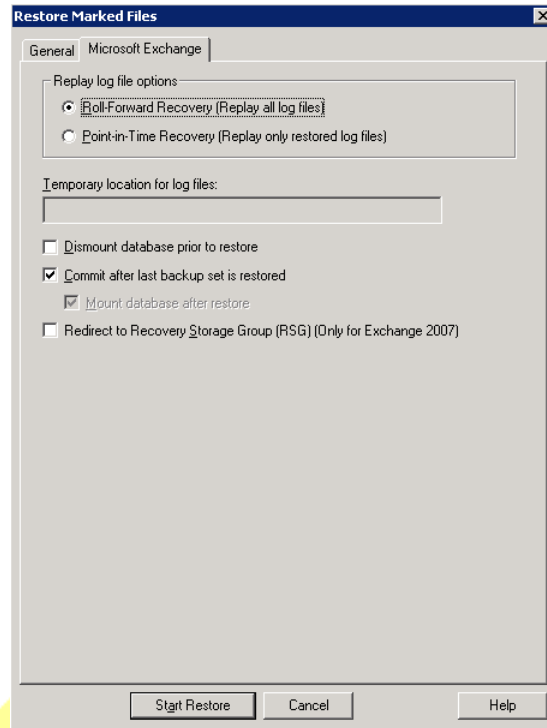

The following figure shows a restore of Exchange 2010.

8 Click **Actions > Restore**.

9 Click the **Microsoft Exchange** tab.

See “[Options for Exchange snapshot restores](#)” on page 151.

10 Click **Start Restore**.

Recovering an Exchange 2007 Local Continuous Replication (LCR) environment

This topic describes how to recover a storage group with LCR enabled. Most of the following PowerShell commands are now available in the Exchange Management Console with Exchange 2007 SP1. You must manually suspend replication in a LCR environment. This applies to VSS and non VSS.

Refer to *Managing Local Continuous Replication* for more information:

<http://technet.microsoft.com/en-us/library/aa998823.aspx>

Follow these steps:

- Issue the PowerShell command `Suspend-StorageGroupCopy` for a storage group before you restore that storage group.
- Perform a database restore.
 See [“Performing a snapshot restore of an Exchange 2007 or earlier server”](#) on page 166.
- You may need to re-seed the copy before you resume the copy.
 Do the following:
 - Remove the database files, all log files, and all checkpoint files from the copy location. (If you use it, the Exchange Management Console prompts you to perform this step.)
 - Issue the PowerShell command `Update-StorageGroupCopy`.
 See *How to Seed a Local Continuous Replication Copy* for more information:
<http://technet.microsoft.com/en-us/library/aa995973.aspx>
- Issue the PowerShell command `Resume-StorageGroupCopy` to properly resume the copy.

Recovering an Exchange 2007 Clustered Continuous Replication (CCR) environment

This topic describes how to recover a storage group with CCR enabled. Most of the following PowerShell commands are now available in the Exchange Management Console with Exchange 2007 SP1. You must manually suspend replication in a LCR environment. This applies to VSS and non VSS.

Note: A restore can only be directed to the active node.

See *Managing Cluster Continuous Replication* for more information:

<http://technet.microsoft.com/en-us/library/aa997676.aspx>

Follow these steps:

- *Reviewer: Need to update this for new Exchange credentials property. Do you want to say, " The account used for the Exchange credentials in the Client host properties must be a privileged domain account. Otherwise, ...If you upgraded from an earlier version of NetBackup the logon account for the NetBackup Client service must be a privileged domain account."*
 For Exchange 2007 pre-SP1, The NetBackup Client Service must be run as a privileged domain account on each node. Otherwise, NetBackup is not properly authorized to perform dismounts or restores.

- Issue the PowerShell command `Suspend-StorageGroupCopy` for a storage group before you restore that storage group.
- Perform a database restore.
See “Performing a snapshot restore of an Exchange 2007 or earlier server” on page 166.
- You may need to re-seed the cluster copy before you resume the copy.
Do the following:
 - Remove the database files, all log files, and all checkpoint files from the passive node. (If you use it, the Exchange Management Console, prompts you to perform this step.)
 - From the passive node, issue the PowerShell command `Update-StorageGroupCopy`.
See *How to Seed a Cluster Continuous Replication Copy* for more information:
<http://technet.microsoft.com/en-us/library/bb124706.aspx>
- Issue the PowerShell command `Resume-StorageGroupCopy` to properly resume the cluster copy.

Redirecting an Exchange 2010 Database Availability Group (DAG) snapshot backup to another database or to the recovery database (RDB)

To redirect an Exchange 2010 snapshot backup to another database or to the recovery database

- 1 *Reviewer: Updated to indicate NetBackup suspends replication for redirects to RDB. 2/26/13*

The following applies to suspending replication:

- If redirecting to another database, manually suspend replication. This step applies for any snapshot provider you use.
- If redirecting to the RDB, NetBackup suspends replication on the target server.

<http://technet.microsoft.com/en-us/library/dd298159.aspx>

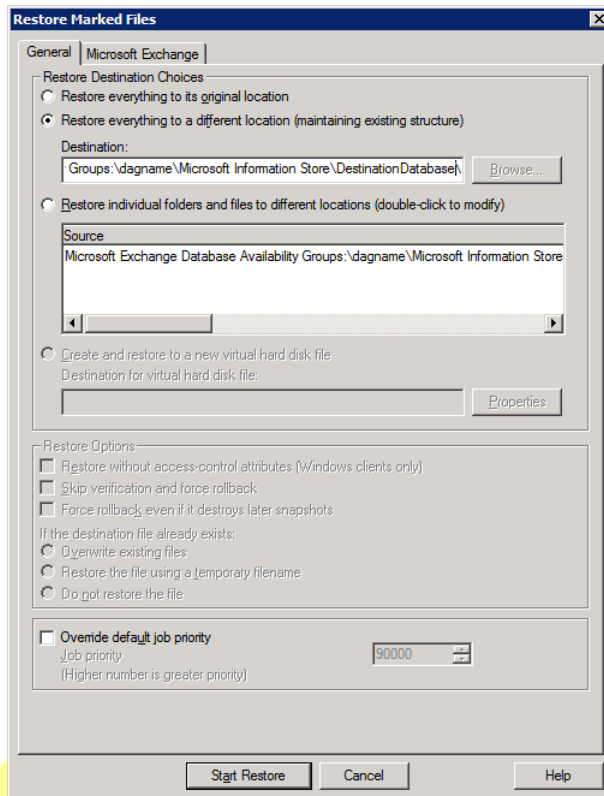

- 2 The database or the recovery database must already exist.
To restore to the RDB, create the RDB on an Exchange server, if necessary. Leave the RDB dismounted.
- 3 Open the Backup, Archive, and Restore interface.
- 4 Click **File > Select Files and Folders to Restore > from Normal Backup**.

- 5 Click **File > Specify NetBackup Machines and Policy Type**.
- 6 In the **Specify NetBackup Machines and Policy Type** dialog box, provide the following information:

Server to use for backups and restores	Select the server that performed the restore.
Source client for restores	Select the virtual DAG name.
Destination clients for restores	<p>To restore to another database in the same DAG, leave the destination client the same as the source client. NetBackup detects the active server to which to redirect the restore.</p> <p>To redirect the restore to a different DAG, indicate the DAG name where that database exists. NetBackup automatically detects the CAS server that is assigned to the database. To restore to the RDB, indicate the DAG name. If the RDB exists on a standalone server, indicate that server name as the destination client.</p> <p>If applicable, review the notes and limitations for redirecting to a different client.</p> <p>See “About selecting a destination client for an Exchange Server restore operation” on page 147.</p>
Policy type for restores	Select MS-Exchange-Server .

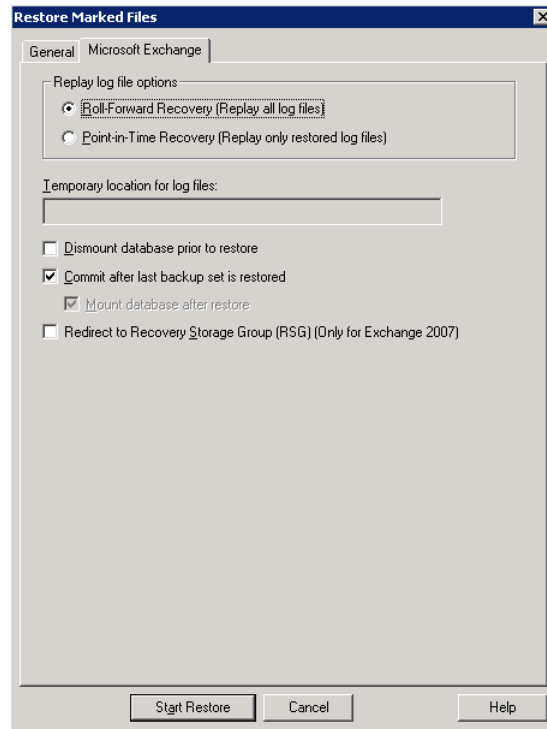

- 7 From the **NetBackup History** pane, select one of the following:
 - The last full backup, or
 - The last full backup and all subsequent differential backups, or
 - The last full backup and the last cumulative backup
- 8 In the **All Folders** pane, expand **Microsoft Exchange Database Availability Groups > Forest or domain name**.
- 9 Select the database you want to restore.
- 10 Click **Actions > Restore**.
- 11 Change the destination path to another database or to the RDB:
 - Click the **General** tab.
 - Select **Restore everything to a different location**.
 - In the **Destination** box, provide the name of the alternate database you want to restore to. Or provide the name of the RDB you previously created.

Exchange 2010 does not automatically redirect a database to its RDB, if it exists.

12 Click the Microsoft Exchange tab.

See [“Options for Exchange snapshot restores”](#) on page 151.

13 Check Commit after last backup set is restored.

If you choose to restore backup images separately, you must check **Commit after last backup set is restored** only when you restore the *last* incremental backup set.

If you do not select **Commit after last backup set is restored**, manually mount the database after the restore is complete.

See [“Manually mounting an Exchange database after a restore”](#) on page 173.

14 Click Start Restore.

The restore is directed to the active Exchange database, regardless of which database was backed up. NetBackup automatically detects the Exchange server that currently contains the active Exchange database.

- 15 *Reviewer: If the user redirected to the RDB, NetBackup manually suspends repl on the target server. Does NetBackup resume replication or does the user need to do it? 2/26/13*

When the restore completes, resume replication.

- 16 If necessary, update the mailbox database copy.

<http://technet.microsoft.com/en-us/library/dd351100.aspx>

Redirecting an Exchange 2010 or later standalone server snapshot backup to another database or to the recovery database (RDB)

This topic describes how to redirect a snapshot backup of an Exchange 2010 or later standalone server to another database or the recovery database (RDB).

To redirect an Exchange 2010 or later standalone server snapshot backup to the recovery database

- 1 The database or the recovery database must already exist.
To restore to the RDB, create the RDB on an Exchange server, if necessary. Leave the RDB dismounted.
- 2 Open the Backup, Archive, and Restore interface.
- 3 Click **File > Select Files and Folders to Restore > from Normal Backup**.
- 4 Click **File > Specify NetBackup Machines and Policy Type**.
- 5 In the **Specify NetBackup Machines and Policy Type** dialog box, provide the following information:

Server to use for backups and restores

Select the server that performed the restore.

Destination clients for restores

To restore to the RDB on a different server, change the destination client to the Exchange server that hosts the RDB. This client must be the Exchange server that hosts the database to which you want to redirect the restore. Also review the notes and limitations for redirecting to a different client.

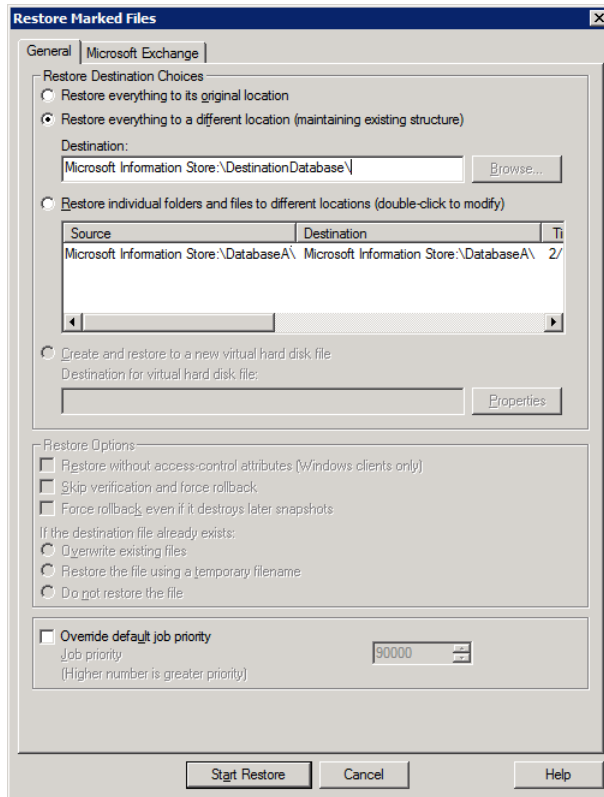

See [“About selecting a destination client for an Exchange Server restore operation”](#) on page 147.

To restore to the RDB or to a database on the local server, leave the destination client the same as the source client.

Policy type for restores

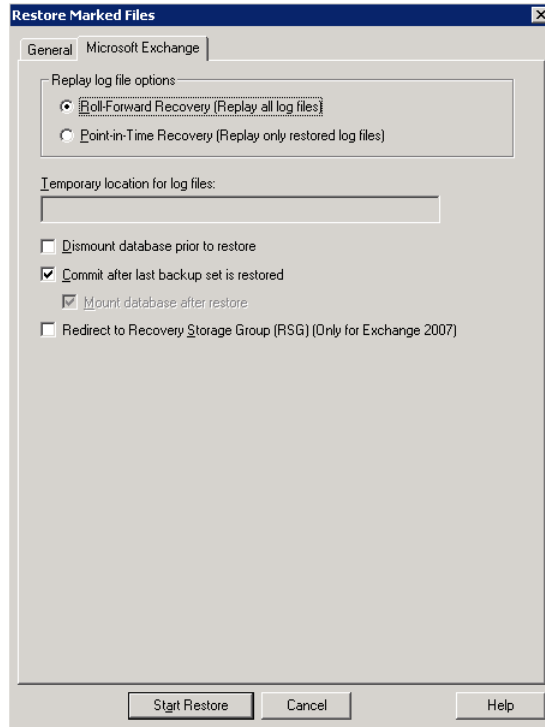

Select **MS-Exchange-Server**.

- 6 From the **NetBackup History** pane, select one of the following:
 - The last full backup, or
 - The last full backup and all subsequent differential backups, or
 - The last full backup and the last cumulative backup
- 7 In the **All Folders** pane, expand **Microsoft Information Store**.
- 8 Select the database you want to restore.
- 9 Click **Actions > Restore**.
- 10 In the **Restore Marked Files** dialog box, click the **General** tab.
- 11 Change the destination path to another database or to the RDB:
 - Select **Restore everything to a different location**.
 - In the **Destination** box, provide the name of the alternate database you want to restore to. Or provide the name of the RDB you previously created. Exchange does not automatically redirect a database to its RDB, if it exists.

12 Click the Microsoft Exchange tab.

See [“Options for Exchange snapshot restores”](#) on page 151.

13 Check Commit after last backup set is restored.

If you choose to restore backup images separately, you must check **Commit after last backup set is restored** only when you restore the *last* incremental backup set.

If you do not select **Commit after last backup set is restored**, manually mount the database after the restore is complete.

See [“Manually mounting an Exchange database after a restore”](#) on page 173.

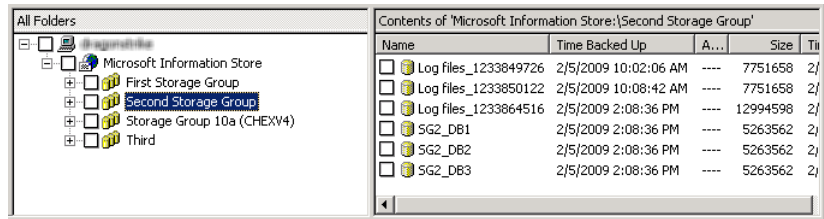

14 Click Start Restore.

Performing a snapshot restore of an Exchange 2007 or earlier server

To perform a snapshot restore of an Exchange 2007 or earlier server

- 1 Dismount all Exchange databases that you want to restore.
Or, when you perform the restore, click the **Dismount database prior to restore** option.
- 2 Open the Backup, Archive, and Restore interface.
- 3 Click **File > Select Files and Folders to Restore > from Normal Backup**.
- 4 Select **File > Specify NetBackup Machines and Policy Type**.
- 5 In the **Specify NetBackup Machines and Policy Type** dialog box, provide the following information:
 - The server that performed the restore.
 - If you have an Exchange 2007 cluster environment, for the source client select the virtual Exchange server name.
See [“About selecting a source client for an Exchange Server backup operation”](#) on page 138.
 - For the policy type, select **MS-Exchange-Server**.
- 6 From the **NetBackup History** pane, click the backup image that contains the objects you want to restore as follows:
 - The last full backup or user-directed backup
 - The last full backup and all subsequent differential backups
 - The last full backup and the last cumulative backup
- 7 In the **All Folders** pane, select the objects you want to restore, as follows:
 - The Microsoft Information Store.
Click the checkbox next to the computer name or the **Microsoft Information Store**.
 - Storage groups.
Expand the **Microsoft Information Store** node and select the storage group to restore.
 - Databases.
Expand the **Microsoft Information Store** node and the storage group.
Then select the database(s) and log files you want to restore.

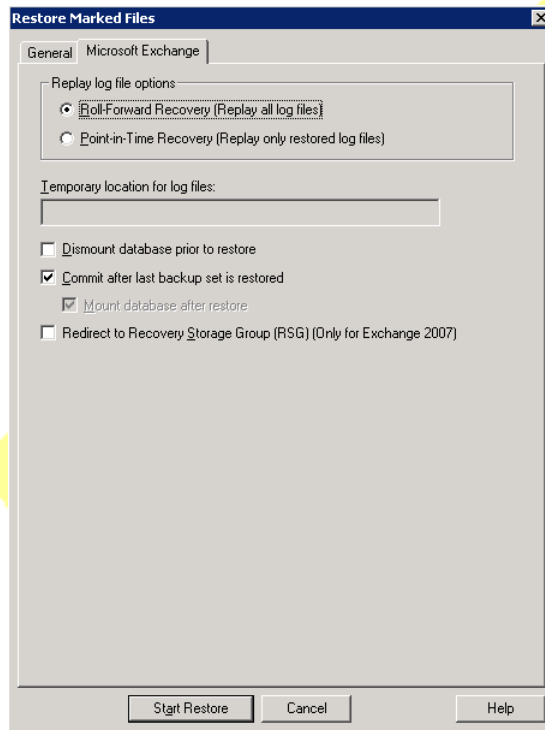

The following figure shows a restore of an Exchange 2007 storage group.

8 Click **Actions > Restore**.

9 Click the **Microsoft Exchange** tab.

See [“Options for Exchange snapshot restores”](#) on page 151.

10 Click **Start Restore**.

Redirecting an Exchange 2007 snapshot backup to a storage group

This topic describes how to redirect an Exchange 2007 snapshot backup to a storage group.

For further instructions, refer to the following information on recovery storage groups on Microsoft's Technet site:

<http://technet.microsoft.com/en-us/library/aa997260.aspx>

To redirect an Exchange 2007 snapshot backup to a storage group

- 1 The destination storage group must already exist. Create a storage group that has databases. Those databases must have the same names as those in the original storage group.
- 2 Open the Backup, Archive, and Restore interface.
- 3 Click **File > Select Files and Folders to Restore > from Normal Backup**.
- 4 Click **File > Specify NetBackup Machines and Policy Type**.
- 5 In the **Specify NetBackup Machines and Policy Type** dialog box, provide the following information:

Server to use for backups and restores Select the server that performed the restore.

Destination clients for restores If you want to restore to a different server, change the destination client to the **Exchange server** that hosts the storage group. Also review the notes and limitations for redirecting to a different client.

See [“About selecting a destination client for an Exchange Server restore operation”](#) on page 147.

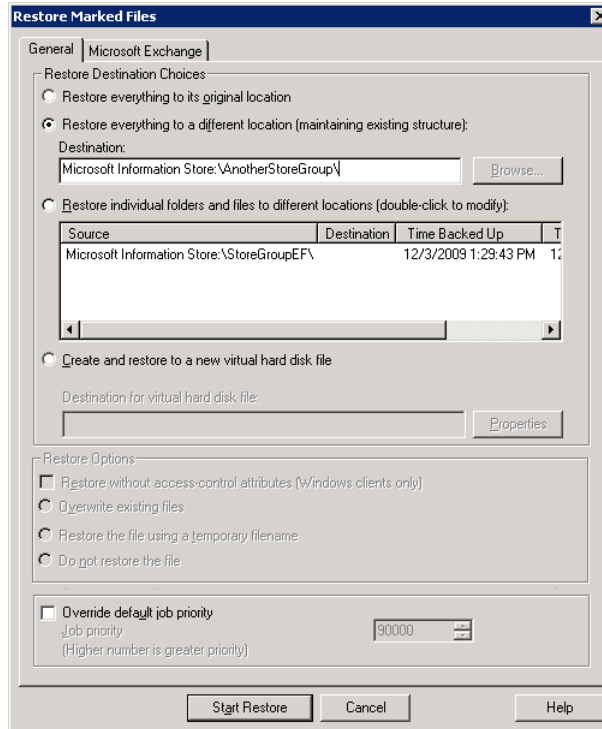

If you want to restore a storage group to the local server, leave the destination client the same as the source client.

Policy type for restores Select **MS-Exchange-Server**.

- 6 From the **NetBackup History** pane, select one of the following:
 - The last full backup, or
 - The last full backup and all subsequent differential backups, or
 - The last full backup and the last cumulative backup
- 7 In the **All Folders** pane, expand the Microsoft Information Store.
- 8 Select the storage group you want to restore.
- 9 Click **Actions > Restore**.
- 10 In the **Restore Marked Files** dialog box click the **General** tab.

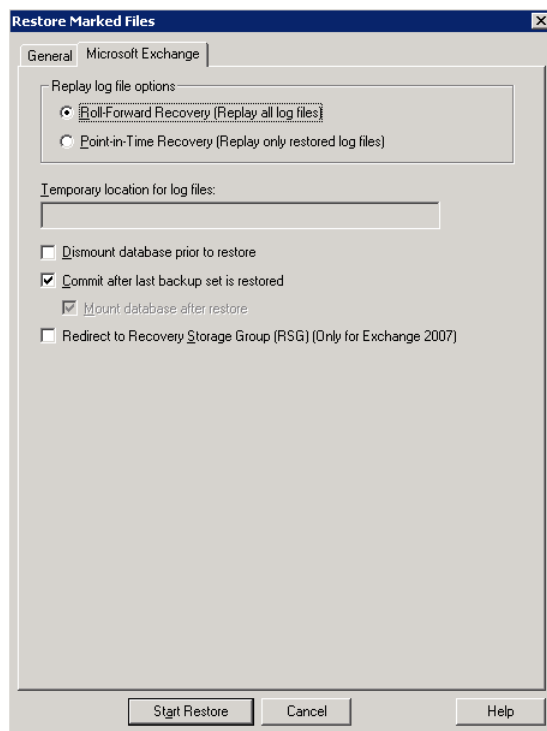

11 Select **Restore everything to a different location**.

12 Change the **Destination** path.

13 Click the **Microsoft Exchange** tab.

See [“Options for Exchange snapshot restores”](#) on page 151.

14 Check **Commit after last backup set is restored**.

If you choose to restore backup images separately, you must check **Commit after last backup set is restored** only when you restore the *last* incremental backup set.

If you do not select **Commit after last backup set is restored**, manually mount the database after the restore is complete.

See [“Manually mounting an Exchange database after a restore”](#) on page 173.

15 Click **Start Restore**.

Redirecting an Exchange 2007 snapshot backup to the recovery storage group

This topic describes how to redirect an Exchange 2007 snapshot backup to the recovery storage group (RSG). With snapshot backups, you do not need to redirect

a restore to the RSG as long as the RSG already exists and is added for the selected storage group and database(s). The restore is automatically restored to the RSG.

Note:

Reviewer: Issue reported by Aaron , added 10/8/12

To successfully redirect to the RSG, in Exchange you must configure the same path for the **Transaction log file folder** and the **System folder and checkpoint file folder**. For an existing RSG, remove the RSG and recreate it.

For further instructions, refer to the following information on recovery storage groups on Microsoft's Technet site:

<http://technet.microsoft.com/en-us/library/aa997260.aspx>

To redirect an Exchange 2007 snapshot backup to the recovery storage group

- 1 The RSG must already exist. Create the RSG and the databases you want to recover on an Exchange server, if necessary. Leave the RSG dismounted.
- 2 Open the Backup, Archive, and Restore interface.
- 3 Click **File > Select Files and Folders to Restore > from Normal Backup**.
- 4 Click **File > Specify NetBackup Machines and Policy Type**.
- 5 In the **Specify NetBackup Machines and Policy Type** dialog box, provide the following information:

Server to use for backups and restores

Select the server that performed the restore.

Destination clients for restores

If you want to restore to a different server, change the destination client to the Exchange server that hosts the RSG. Also review the notes and limitations for redirecting to a different client.

See "[About selecting a destination client for an Exchange Server restore operation](#)" on page 147.

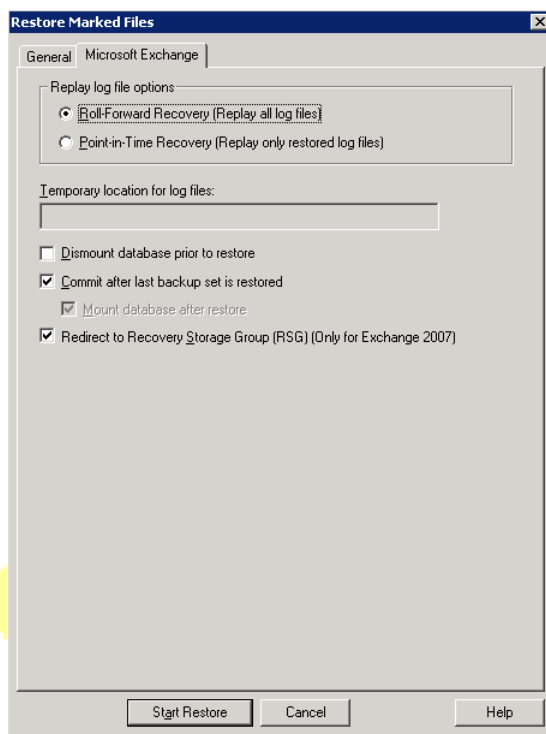

If you want to restore the RSG to the local server, leave the destination client the same as the source client.

Policy type for restores

Select **MS-Exchange-Server**.

- 6 From the **NetBackup History** pane, select one of the following:
 - The last full backup, or
 - The last full backup and all subsequent differential backups, or

- The last full backup and the last cumulative backup
 - 7 In the **All Folders** pane, expand the Microsoft Information Store.
 - 8 Select the storage group you want to restore.
 - 9 Click **Actions > Restore**.
 - 10 Click the **Microsoft Exchange** tab.
- See [“Options for Exchange snapshot restores”](#) on page 151.

- 11 Check **Commit after last backup set is restored**.

If you choose to restore backup images separately, you must check **Commit after last backup set is restored** only when you restore the *last* incremental backup set.

If you do not select **Commit after last backup set is restored**, manually mount the database after the restore is complete.

See [“Manually mounting an Exchange database after a restore”](#) on page 173.

- 12 Check **Redirect to Recovery Storage Group (RSG) (Only for Exchange 2007)**.
- 13 Click **Start Restore**.

About redirecting restores of Exchange 2003 snapshot backup images

Reviewer: Rob, you asked why 2003 appears in the doc. I thought 2003 restores (but not backups) are supported in 7.6.

The following limitations and requirements exist to redirect restores of Exchange 2003 snapshot backups:

- You cannot restore an Exchange 2003 snapshot backup to an RSG.
- With this Exchange version, you cannot redirect to a different storage group on the local server.
- If you want to redirect to a storage group on another server the storage group and the database must be identical. The path(s) of the storage group also must be identical to the original storage group.

Manually mounting an Exchange database after a restore

If you did not click **Commit after last backup set is restored**, you need to mount the database manually after the restore is completed.

To mount a database manually after a restore

- 1 Mount all of the databases that were restored in the storage group.
- 2 If the mount fails, try a soft recovery (ignore mismatched database attachments) of the Exchange databases to bring the databases to a consistent state.

```
eseutil /r E0n /i
```

- 3 Mount the databases again.

About restoring streaming backups of Exchange Server (Exchange 2007 and earlier)

NetBackup can restore the following Exchange Server objects from streaming backups:

- Microsoft Information Store
- Storage groups
- Storage group databases

You can also redirect a restore to the recovery storage group (RSG).

See [“Redirecting an Exchange 2007 or Exchange 2003 streaming backup to a recovery storage group”](#) on page 177.

Options for streaming restores of Exchange databases

Different options are available when you perform a snapshot restore.

See [“Options for Exchange snapshot restores”](#) on page 151.

Table 7-2 Restore options for streaming restores of Exchange databases

Option	Description
Roll-Forward Recovery (Replay all log files)	Retains the existing transaction logs. Exchange replays the transaction logs that are part of the restore, followed by any transaction logs that currently exist. See “About existing Exchange Server transaction logs” on page 149.
Point-in-Time Recovery (Replay only restored log files)	Restores the database and replaces only the transaction logs that existed at the time of backup.
Temporary location for log files	Enter a location where the associated log files are kept until the database is restored. The default location is <code>c:\temp</code> . If you choose to restore storage groups, NetBackup creates a subdirectory in <code>c:\temp</code> for each storage group. It keeps log files for each storage group in the corresponding subdirectory. If Commit after last backup set is restored is selected during the restore, Exchange applies to the database. Then it applies the current log files. After the restore is complete, Exchange deletes the log files from the temporary location (including any subdirectories). Note: Make sure the temporary location for log files is empty before you start a restore job. If a restore job fails, check the temporary location (including subdirectories) to make sure any previous log files from a previous restore job were deleted.
Dismount database prior to restore	Dismounts the database(s) before the restore begins. This option dismounts all of the databases in the storage groups that you want to restore, even if a database is not selected for restore. By default this option is not selected. This option also sets the Database can be overwritten by a restore flag in Exchange 2007. Note: Use this option with caution. Ensure that you selected the correct database to restore before you choose to dismount it with this option.

Table 7-2 Restore options for streaming restores of Exchange databases
(continued)

Option	Description
Commit after last backup set is restored	<p>This option should only be set on the last job of a multi-job restore. This option enables the restore operation to play through log files and roll back any uncompleted transactions. If this option is not selected, the database needs to be mounted manually after the restore.</p> <p>If Commit after last backup set is restored is selected when an intermediate backup is applied, you cannot restore further backups. You must restart the restore operation from the beginning.</p>
Mount database after restore	Mounts the database so that it is available to users.
Redirect to Recovery Storage Group (RSG) (Only for Exchange 2007)	This option is not applicable for streaming restores.
Start Restore	Initiates the restore operation.

Restoring storage groups or storage group databases from a streaming backup

This topic describes how to restore storage groups or databases.

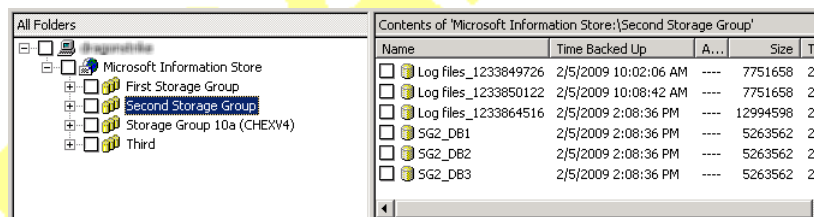

Note: A restore of Exchange Server files always overwrites any existing files. For example, if `Pub.edb` already exists on the target computer, it is replaced with the copy from the backup.

To restore storage groups or storage group databases from a streaming backup

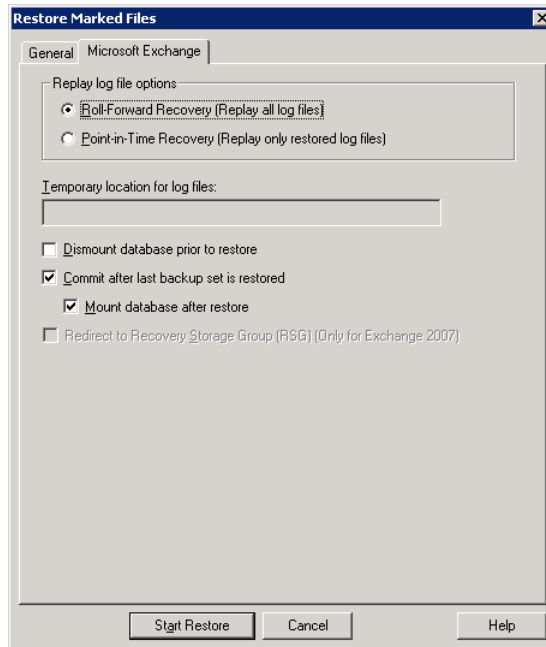

- 1 Log onto the server as Administrator.
- 2 Dismount all Exchange databases that need to be restored.
 Or, when you perform the restore, click the **Dismount database prior to restore** option.
- 3 Open the Backup, Archive, and Restore interface.
- 4 Click **File > Select Files and Folders to Restore > from Normal Backup**.
- 5 Click **File > Specify NetBackup Machines and Policy Type**.
- 6 In the **Specify NetBackup Machines and Policy Type** dialog box, provide the following information:

- The server that performed the restore.
 - For the policy type, select **MS-Exchange-Server**.
- 7 From the NetBackup History pane, select one of the following:
- The last full backup
 - The last full backup and all subsequent differential backups
 - The last full backup and the last cumulative backup
- 8 In the **All Folders** pane, select the objects you want to restore:
- Storage groups.
Expand **Microsoft Information Store** and click the storage group to restore.
 - Individual databases.
To restore an individual database within a specific storage group, expand **Microsoft Information Store**, then the storage group, and click the database.

A full backup of an Exchange database includes the database transaction log files. When you restore a database, you must also restore the transaction log files.

9 Click **Actions > Restore**.

10 Select the restore options you want.

See [“Options for streaming restores of Exchange databases”](#) on page 174.

11 If you chose to restore the backups individually, uncheck **Commit after last backup set is restored** for the full and all but the last incremental backup.

When you restore the *last* incremental backup set, check **Commit after last backup set is restored** and **Mount database after restore**.

12 Click **Start Restore**.

13 If you restored storage groups and did not click **Mount database after restore** (after the restore), be sure to mount the storage group databases that were restored.

Redirecting an Exchange 2007 or Exchange 2003 streaming backup to a recovery storage group

NetBackup supports restores to the recovery storage group. With streaming backups, you must redirect the restore. The restore is not automatically restored to the recovery storage group.

For further instructions, refer to the following information on recovery storage groups on Microsoft's Technet site:

Exchange 2007 <http://technet.microsoft.com/en-us/library/aa997260.aspx>

Exchange 2003 <http://technet.microsoft.com/en-us/library/aa998782.aspx>

To redirect an Exchange 2007 or Exchange 2003 streaming backup to a recovery storage group

- 1 Log onto the server as Administrator.
- 2 Create the RSG on the target Exchange Server, if necessary.
- 3 (Exchange 2007) Dismount all Exchange databases you want to restore.
Or, when you perform the restore, click the **Dismount database prior to restore** option.
- 4 Confirm that the RSG databases are **not** mounted.
- 5 Open the Backup, Archive, and Restore interface.
- 6 Click **File > Select Files and Folders to Restore > from Normal Backup**.
- 7 Click **File > Specify NetBackup Machines and Policy Type**.
- 8 In the **Specify NetBackup Machines and Policy Type** dialog box, provide the following information:

Destination clients for restores

If you want to restore to a different server, change the destination client to the Exchange server that holds the RSG. Also review the notes and limitations for redirecting to a different client.

See ["About selecting a destination client for an Exchange Server restore operation"](#) on page 147.

If you want to restore to the local server, leave the destination client the same as the source client.

Policy type for restores

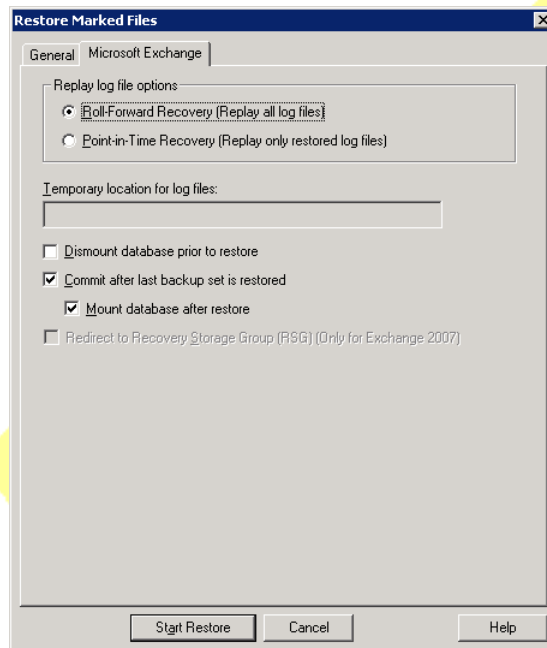

Select MS-Exchange-Server.

- 9 From the **NetBackup History** pane, select one of the following:
 - The last full backup
 - The last full backup and all subsequent differential backups
 - The last full backup and the last cumulative backup
- 10 In the **All Folders** pane, click the objects you want to restore:

- A storage group
Expand the Microsoft Information Store node and click the storage group to restore.
- Individual databases
To restore an individual database within a specific storage group, expand the Microsoft Information Store, then the storage group, and click the database.

A full backup of an Exchange database includes the database transaction log files. When you restore a database, you must also restore the transaction log files.

11 Click **Actions > Restore.**

12 To restore the backups individually, click **Commit after last backup set is restored and **Mount database after restore** when you restore the *last* incremental backup set.**

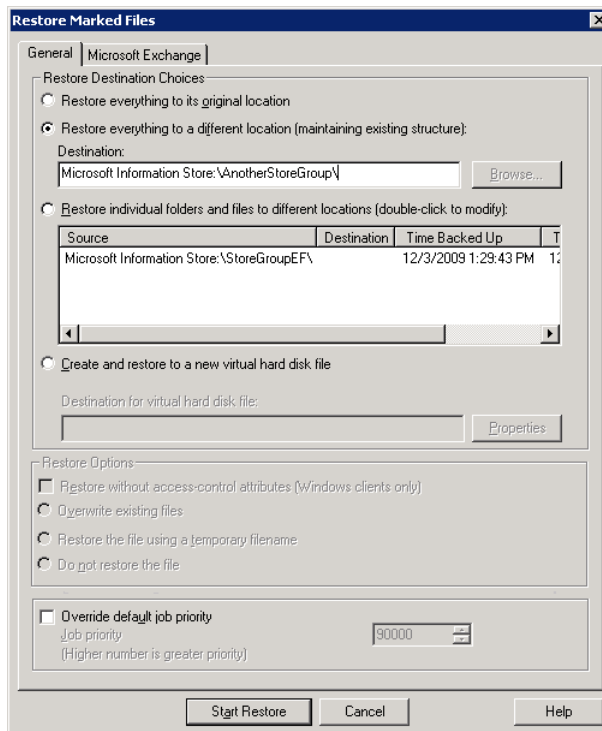

13 Select the other restore options you want.

See [“Options for streaming restores of Exchange databases”](#) on page 174.

14 Click the **General tab.**

15 Select **Restore everything to a different location**.

16 Change the **Destination** path.

17 Click **Start Restore**.

18 If you chose to restore storage groups and you did not click **Mount database after restore** (after the restore), mount the storage group databases that were restored.

About restoring individual Exchange mailbox and public folder items

You can restore individual mailbox or public folder items (folders, messages, and documents) from streaming or snapshot backups with Granular Recovery Technology (GRT) enabled. Refer to the following topics:

See [“About special characters in Exchange mailbox folders and message subjects”](#) on page 181.

See [“Prerequisites and operational notes for restoring Exchange individual mailboxes, mailbox folders, public folders, or messages”](#) on page 181.

About special characters in Exchange mailbox folders and message subjects

NetBackup uses escape sequences for slashes and backslashes in mailbox folder names and message subjects because the objects are handled using file path syntax. The tilde (~) character is the escape character, so it also has to be escaped.

When you browse for items to restore, you see the escaped character sequences. Use [Table 7-3](#) to convert the translated characters back to the characters that appear in the restored items.

Table 7-3 Translation of special characters in mailbox folders and message subjects

Character	Translation
~	~0
/	~1
\	~2

Prerequisites and operational notes for restoring Exchange individual mailboxes, mailbox folders, public folders, or messages

Review the following information before you restore individual mailboxes, mailbox folders, public folders, or messages:

- The destination mailbox must exist to successfully restore a mailbox.
- When you restore mailbox messages or public folder documents, the option **Overwrite existing message(s)** overwrites the contents and properties of the original objects. Messages are overwritten regardless of their location. (For example, if the messages were moved to the “Deleted Items” folder.) If the original message no longer exists, a new message is generated with the same contents and properties. A new message is also generated if a new destination location is entered.

If the option **Do not restore the message(s)** is selected, NetBackup skips the restore of any message that still exists, regardless of the current location.

Note that if the original message(s) no longer exists, a restore of the message(s) generates a new copy every time it is restored. A restored copy of the message does not count as the original message in the existence check.

- Restores that use Granular Recovery Technology (GRT) must be made from a disk storage unit. You cannot restore from the tape copy.
- *Reviewer: ET2714502 Updated 10/22/12 with reason why operation fails.*
 For Exchange 2010 restores that use granular recovery (GRT), restores of individual items from a linked mailbox fail because NetBackup cannot impersonate or log on as a user that is not active in the present domain. Redirect the restore to a local mailbox and then use the Exchange System Management Tools to move the items to the linked mailbox.
- NetBackup can back up the online archive mailbox for users. However, a restore from a backup using GRT by default restores the items to the user's mailbox and not the archive mailbox. Items are restored starting at the root of the mailbox hierarchy. Alternatively, you may want to redirect the restore to the path `Top of Information Store\Inbox\Archives\`.
- Exchange Server provides a feature to retain deleted items for a period of time after you "permanently" delete them. Because the deleted items still exist, NetBackup includes them in the backup image. NetBackup displays these items when you browse the granular backup image and you can restore these items.

Options for restores of Exchange Server mailbox objects or public folder objects

When you restore mailbox or public folder objects, NetBackup may encounter messages that already exist in the database. Select one of the options from [Table 7-4](#) to indicate whether NetBackup should pass over or replace the pre-existing object.

Note: These options are ignored for a redirected restore.

Table 7-4 Restore options for restores of Exchange Server mailbox objects of public folder objects

Option	Description
Do not restore the message(s)	Does not restore mailbox messages if they already exist.
Overwrite the message	Replaces the existing message with the one from the backup.

Restoring Exchange mailbox or public folder objects

To restore a mailbox object to a different location, you follow a different procedure.

See [“About redirecting a restore of Exchange mailbox or public folder objects to a different path”](#) on page 186.

Note: Browse time for a backup that uses Granular Recovery Technology may take longer than for a non-granular backup image. The media server gathers granular information at this time and wait times may vary. Depending on the load on the media server, you may need to increase the **Client read timeout** value. This option is located in the Client host properties in the **Timeouts** tab.

Note: Do not restore mailbox or public folder backups and database backups in the same restore job. If the database restore starts first, NetBackup dismounts the database during the restore. Or it requires that the database be dismounted before the restore. Then the database being dismounted causes the mailbox or public folder object restore to fail. Or, the restore of the Exchange mailbox or public folder items finishes before the restore of the Exchange databases starts. Then the restore of the Exchange databases deletes the restored mailbox or public folder objects.

Note: Do not restore in the same restore job any backups that use Granular Recovery Technology with any backups that do not.

To restore mailbox or public folder objects

- 1 Log onto the server as Administrator.
- 2 Open the Backup, Archive, and Restore interface.
- 3 Click **File > Select Files and Folders to Restore > from Normal Backup**.
- 4 Click **File > Specify NetBackup Machines and Policy Type**.
- 5 In the **Specify NetBackup Machines and Policy Type** dialog box, select the server and the policy type.
- 6 From the **NetBackup History** pane, click the image(s) that contain the objects you want to restore.

Symantec recommends that you select one backup image set at a time for individual item restore. While this recommendation is not a restriction, you may at times restore more copies of messages than you intend.

You cannot restore individual items from a snapshot incremental backup that uses Granular Recovery Technology (GRT).

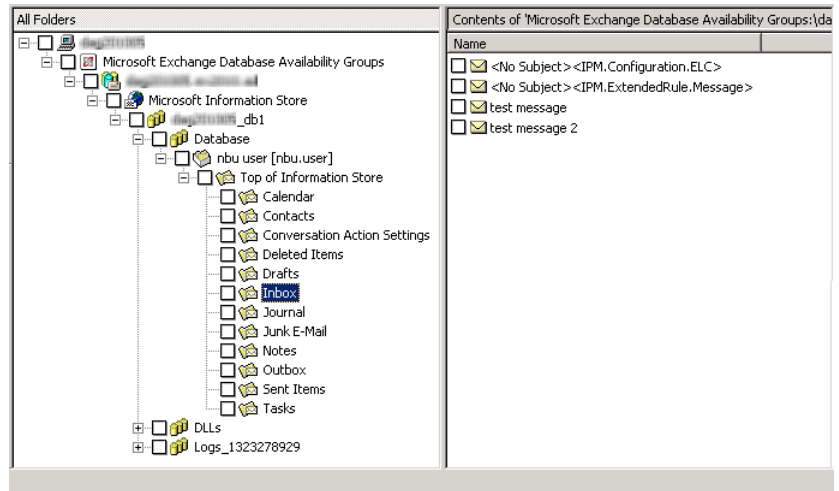

Select one of the following:

- The last full backup

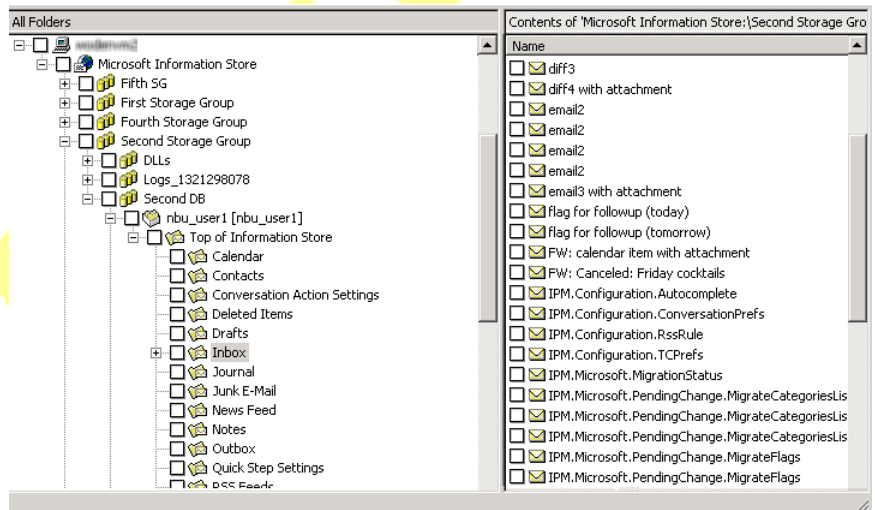

- The last full backup and all subsequent differential backups
 - The last full backup and the last cumulative backup
- 7 Expand one of the following:
- **Microsoft Exchange Database Availability Groups > *Forest or Domain* > Microsoft Information Store > *Mailbox Database***
 - **Microsoft Exchange Database Availability Groups > *Forest or Domain* > Microsoft Information Store > *Public Store***
 - **Microsoft Information Store > *Mailbox Database***
 - **Microsoft Information Store > *Public Store***
 - **Microsoft Information Store > *Storage Group* > *Mailbox Database***
 - **Microsoft Information Store > *Storage Group* > *Public Store***
- 8 In the **All Folders** pane, select objects you want to restore from the following:
- Mailboxes
 - Mailbox folders
 - Mailbox objects
 - Public folders
 - Documents in a public folder

You can ignore the `DLLs` folder.

The following figure shows a restore of a DAG using Granular Recovery Technology (GRT).

The following figure shows an Exchange 2007 restore using Granular Recovery Technology.

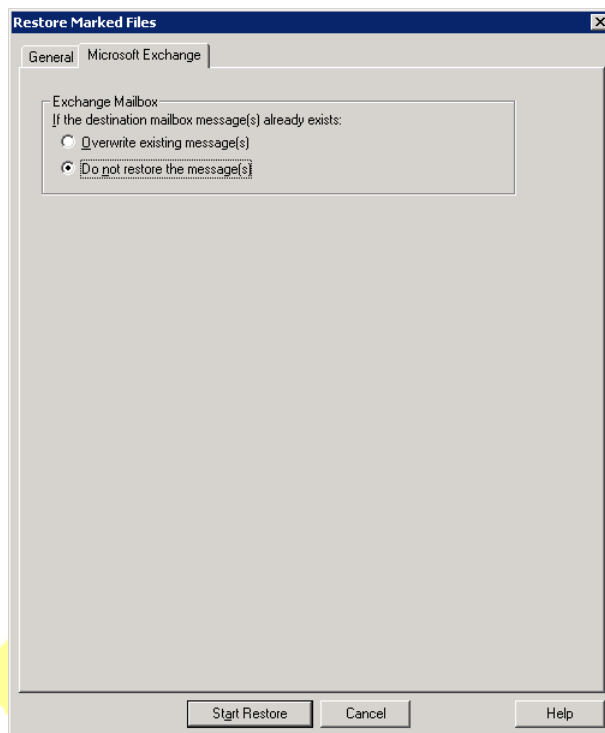

All objects appear as folders and messages. You can identify some non-message objects by the subject line. For example, if you create a Calendar event named Appointment1, that name appears in the subject line for that object.

However, some objects such as Forms and Views do not have a subject line (even though they can be named). They may not be so easily identified.

9 Click **Actions > Restore**.

10 On the **Microsoft Exchange** tab, choose whether or not to restore existing mailbox messages.

See [“Options for restores of Exchange Server mailbox objects or public folder objects”](#) on page 182.

11 You can restore individual mailbox items to alternate mailboxes or mailbox folders.

See [“About redirecting a restore of Exchange mailbox or public folder objects to a different path”](#) on page 186.

12 Click **Start Restore**.

About redirecting a restore of Exchange mailbox or public folder objects to a different path

NetBackup can restore Exchange mailbox or public folder objects to different locations.

Refer to the following topics for more information and instructions:

- See [“About requirements for redirecting the restore of an Exchange mailbox or public folder object to a different path”](#) on page 187.
- See [“Redirecting the restore of an Exchange mailbox, mailbox folder, or public folder”](#) on page 188.
- See [“Redirecting a restore of an Exchange mailbox or a public folder object to a different path”](#) on page 190.

About requirements for redirecting the restore of an Exchange mailbox or public folder object to a different path

Reviewer: Added 12/20/12

Review the following requirements for redirecting the restore of an Exchange mailbox or public folder to a different path:

- You must indicate an explicit path (or full path).
- In the destination path, the following segment of the path cannot be changed:
 Microsoft Exchange Database Availability Groups:\
 Microsoft Information Store\
 If you change this part of the path, NetBackup attempts to restore the objects as normal (non-Exchange) files.
- The destination mailbox or destination folder must have an associated user account.
- When you redirect a restore of public folders, the folder you indicate in the destination path does *not* have to exist.
- (Exchange 2010) When you redirect a restore from a granular backup, consider the following example restore destinations:

Reviewer: Updated these paths 2/26/13

```
Microsoft Exchange Database Availability Groups:\server1\My-database\Database\
John Q. Employee [JQEmployee]\Top of Information Store\Inbox\
```

```
Microsoft Information Store:\My-database\Database\John Q. Employee [JQEmployee]\
Top of Information Store\Inbox\
```

In the examples, note the following:

- *server1* can be the target server.
- *My-database*, must be valid database on target server (but is not directly accessed).
- *John Q. Employee*, must be a valid and accessible mailbox.

- (Exchange 2007) When you redirect a restore from a granular backup, consider the following example restore destination:

Microsoft Information Store:\My-Storage-Group\My-database\John Q. Employee [JQEmployee]\
Top of Information Store\Inbox

In the example, note the following:

- *My-Storage-Group*, must be valid storage group on target server (but is not directly accessed) .
- *My-database*, must be valid database on target server (but is not directly accessed).
- *John Q. Employee*, must be a valid and accessible mailbox.

Redirecting the restore of an Exchange mailbox, mailbox folder, or public folder

This topic describes how to redirect the restore of a mailbox, mailbox folder, or public folder to a different mailbox or public folder.

To redirect the restore of a mailbox, mailbox folder, or public folder

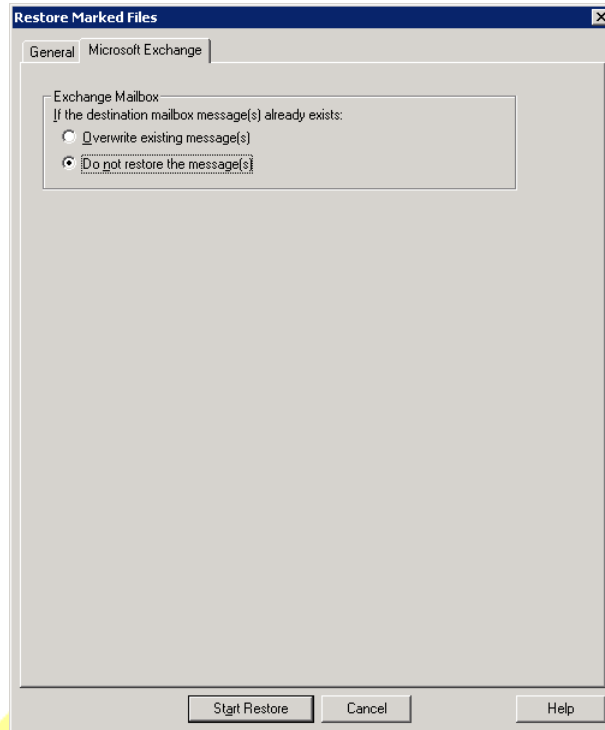

- 1 Log onto the server as Administrator.
- 2 Open the Backup, Archive, and Restore interface.
- 3 Click **File > Select Files and Folders to Restore > from Normal Backup**.
- 4 Click **File > Specify NetBackup Machines and Policy Type**.
- 5 In the **Specify NetBackup Machines and Policy Type** dialog box, select the server and the policy type.
- 6 From the **NetBackup History** pane, click the image(s) that contain the objects you want to restore. Select one of the following:
 - The last full backup
 - The last full backup and all subsequent differential backups
 - The last full backup and the last cumulative backup

You cannot restore individual items from an incremental backup that uses Granular Recovery Technology (GRT).

- 7 In the **All folders** or right pane, click the mailbox or public folder to restore.
- 8 Click **Actions > Restore**.

- 9 On the **Microsoft Exchange** tab, select the restore options you want.

See “Options for restores of Exchange Server mailbox objects or public folder objects” on page 182.

- 10 On the **General** tab, click **Restore everything to a different location**.

- 11 In the **Destination** box, indicate where you want to restore the object. You must indicate an explicit path (or full path).

Writer: Need new screenshot

- Change the mailbox name to another existing mailbox. For example, if you want to restore the contents of Mailbox 1 to Mailbox 2\Folder, specify one of the following in the **Destination** box:

Reviewer: Updated these destination folders 2/26/13

Microsoft Exchange Database Availability Groups:\DAG\Microsoft Information Store\
My-database\Database\mailbox2 [mailbox2]

Microsoft Information Store:\My-database\Database\mailbox2 [mailbox2]\

Microsoft Information Store:\Storage Group\Mailbox Database\mailbox2 [mailbox2]\

- When you restore public folders, change the public folder name to the folder to which you want to restore. This folder does not have to exist.

12 Click **Start Restore.**

Redirecting a restore of an Exchange mailbox or a public folder object to a different path

This topic describes how to restore a mailbox or a public folder object to a different path.

To restore a mailbox or a public folder object to a different path

- 1** Log onto the server as Administrator.
- 2** Click **File > Select Files and Folders to Restore > from Normal Backup**.
- 3** Click **File > Specify NetBackup Machines and Policy Type**.
- 4** In the **Specify NetBackup Machines and Policy Type** dialog box, select the server and the policy type.
- 5** From the **NetBackup History** pane, click the image(s) that contain the folder you want to restore.

Select one of the following:

- The last full backup
- The last full backup and all subsequent differential backups
- The last full backup and the last cumulative backup

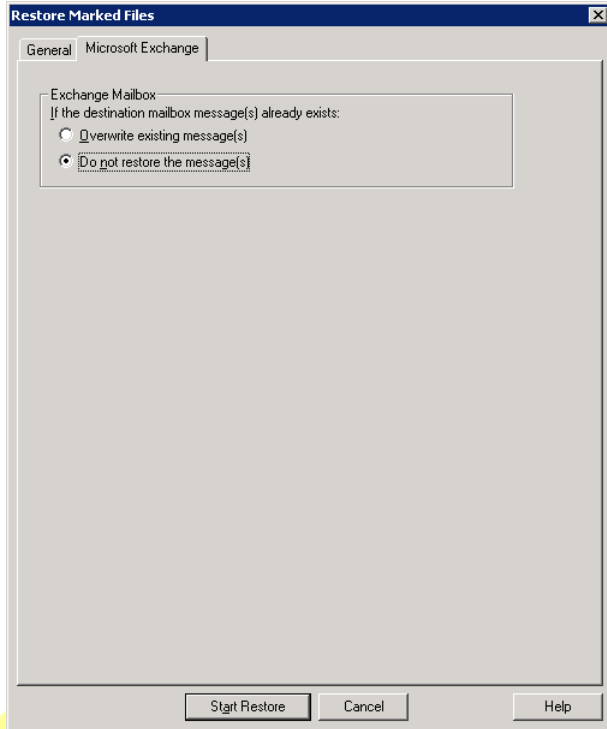

You cannot restore individual items from an incremental backup that uses Granular Recovery Technology (GRT).

- 6** In the **Contents of** or right pane, click the folders, messages, or documents to restore.

If you select items in the **All Folders** pane, you cannot redirect individual objects.

- 7** Click **Actions > Restore**.

- 8 On the **Microsoft Exchange** tab, select the restore options you want.
See “Options for restores of Exchange Server mailbox objects or public folder objects” on page 182.

- 9 On the **General** tab, click **Restore individual folders and files to different locations** option.
Each row under **Restore individual folders and files to different locations** is associated with an individual folder, message, or document.
- 10 Double-click a row to modify the restore destination.

- 11** In the **New Destination** box, indicate the mailbox or folder where you want to restore the object(s).

To redirect a mailbox folder or message, the destination can be any existing mailbox or mailbox folder. To redirect a public folder or document, the destination can be a new or existing public folder. You must indicate an explicit path (or full path).

For example, consider that you want to restore the contents of `Inbox` in `Mailbox 1` to the folder `Other` in the same mailbox. Specify one of the following in the **Destination** box:

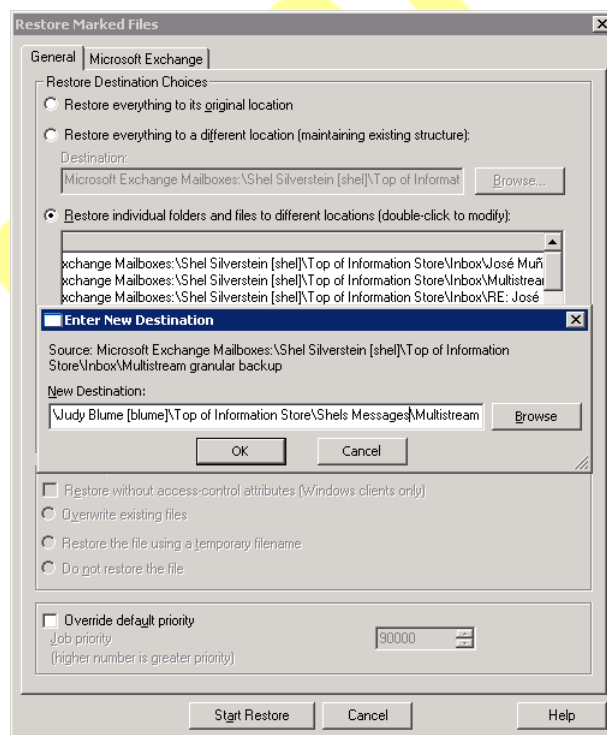

Writer: Need new screenshot

Reviewer: Updated these destination folders 2/26/13

Microsoft Exchange Database Availability Groups:\DAG\Microsoft Information Store\
 My-database\Database\mailbox2 [mailbox2]\Other\

Microsoft Information Store:\My-database\Database\mailbox2 [mailbox2]\Other\

Microsoft Information Store:\Storage Group\Mailbox Database\mailbox2 [mailbox2]\Other\

- 12 Click **OK**.
- 13 Click **Start Restore**.

About using the command line to browse or restore Exchange granular backup images

In addition to the NetBackup Administration Console, you can also use the command line to browse or restore granular backup images:

- When you perform a snapshot restore of mailboxes or mailbox folders, specify the file names as relative to the Microsoft Information Store or DAG and to the storage group or database. For example:

```
Microsoft Exchange Database Availability Groups:\server1\Microsoft Information Store\
My-database\Database\John Q. Employee [JQEmployee]\Top of Information Store\Inbox\
```

```
Microsoft Information Store:\My-database\Database\John Q. Employee [JQEmployee]\
Top of Information Store\Inbox\
```

```
Microsoft Information Store:\My-Storage-Group\My-database\John Q. Employee [JQEmployee]\
Top of Information Store\Inbox
```

- Use the “-granular_proxy” option with the `bpduplicate` command or the `bplist` command to specify a proxy host for a duplication operation. See “[Configuring the Exchange granular proxy host](#)” on page 37. The following example shows how you can specify a proxy host with the `bplist` command:

```
bplist -t 16 -k exchgranpolicy -R -s 06/09/2008 16:00:00
-granular_proxy ProxyServerA "\Microsoft Information Store\StorageGroup1\
DeptA\EmployeeA\Top of Information Store\Inbox\*"
```

About restoring Backup Exec Exchange images with NetBackup

Note that Backup Exec Tape Reader (BETR) support will be dropped after the NetBackup 7.x lifecycle. To restore Backup Exec backup images, follow the instructions for restoring a NetBackup for Exchange image, except select **File > Select Files and Folders to Restore > from Backup Exec Backup**.

Verify that NetBackup supports the restore type of you want to perform. See the following article:

<http://www.symantec.com/docs/TECH125836>

DRAFT

Protecting Exchange Server data with VMware backups

This chapter includes the following topics:

- About protecting Exchange Server data with VMware backups
- About configuring VMware backups that protect Exchange Server
- Installing the Symantec VSS provider for vSphere
- Configuring Granular Recovery Technology (GRT) with a VMware backup that protects Exchange
- About configuring VMware policies to protect Exchange Server
- Configuring a VMware policy to back up Exchange Server
- Configuring a VMware policy to back up Exchange Server using Replication Director to manage snapshot replication
- Configuring NetBackup with access to the CIFS share on the NetApp disk array
- About restoring Exchange data from a VMware backup
- Enabling protection of passive copies of the Exchange database with VMware backups

About protecting Exchange Server data with VMware backups

Through a VMware backup policy, NetBackup can create consistent full backups of an Exchange Server that resides on a virtual machine. From one VMware backup the following restore options are available: restore of the .vmdk (disk level), SFR

restore (file-level recovery), Exchange storage group or database restore, or Exchange granular-level restore (GRT). You can also choose whether or not to truncate logs.

To protect a supported application with a VMware policy the Application State Capture (ASC) job executes after the VMware discovery job and before the snapshot job(s). This ASC job contacts the NetBackup client on the guest virtual machine. The ASC job collects and catalogs application, the specific data that is needed for application recovery and granular recovery (GRT) functionality.

More information is available on the ASC job and its associated logs.

See [“Troubleshooting VMware backups and restores of Exchange Server”](#) on page 230.

About the Symantec VSS provider for vSphere

The Symantec VSS provider is recommended instead of the VMware VSS provider in the following cases:

- You want VMware backups to truncate the logs on Exchange Server virtual machines. The Symantec VSS provider truncates logs for Exchange Server, by means of full VSS backups.
- The virtual machine you want to back up is a node in an Exchange 2010 DAG or an Exchange 2007 CCR. In this case, only the active copies of the database are cataloged and the log files for only those same databases are truncated.
- You want to use an exclude file list for Exchange. See the following for details on how to configure an exclude file list for Exchange.

See [“About excluding Exchange items from backups”](#) on page 106.

When the Symantec VSS provider is installed and NetBackup starts a virtual machine snapshot, VMware Tools calls the Symantec VSS provider to quiesce the VSS writers for a file-level consistent backup. If log truncation is enabled in the policy, the Exchange VSS writer truncates the transaction logs when the VMware snapshot is complete.

Note: The Symantec VSS provider must be installed separately.

See [“Installing the Symantec VSS provider for vSphere”](#) on page 199.

Support for VMware backups that protect Exchange Server

The following are supported with VMware backups that protect Exchange Server:

- ESX Server 4.x or 5.0

- Exchange Server 2013
- Exchange Server 2010
- Exchange Server 2007
- NetBackup 7.6 server software
- NetBackup 7.6 client software is installed on the virtual machine.
- Either the Symantec VSS Provider or the VMware VSS Provider is required. Without one of these providers, database recovery may require manual steps and granular recovery is not supported. Symantec recommends the Symantec VSS provider for the virtual machines that host Exchange.
 See [“About the Symantec VSS provider for vSphere”](#) on page 196.
 Up-to-date support information on the Symantec VSS provider is available in the following tech note:
[Support for NetBackup 7.x in a virtual environment](#)
- VMware backups are supported for stand-alone Exchange servers, DAGs, and CCR clusters.
- *Reviewer: Moved "passive copy" information to a new topic that tells the user how to set the registry key, if wanted. 2/14/13*
 For DAG nodes, NetBackup protects at the node level of a DAG. This behavior is different than for an agent backup, where protection is at the DAG level.

Limitations of using a VMware policy to protect Exchange Server

The following limitations exist when you configure a VMware policy to protect Exchange Server:

- VMware incremental backups of Exchange Server are not supported with this version of NetBackup.
- The Application State Capture (ASC) job fails and the databases are not protected if you do any of the following:
 - Disable the **Virtual Machine quiesce** option.
 - Select the **Exclude data disks** option.
- Databases are cataloged and protected only if they exist in a configuration that is supported for VMware backups. As long as there are any databases that can be protected, the ASC job continues. If you select databases for backup that exist on supported and on unsupported disks, the ASC job produces a status 1 (partially successful). The ASC job detects these situations and the job details include the result of the backup operation.

Exchange Server databases are not cataloged and backed up if they exist on the following:

- Raw device mapping (RDMs). Make sure that the Exchange virtual machine does not use RDM as storage for databases and transaction logs.
- Virtual Machine Disk (vmdk) volumes that are marked as independent. Make sure that the Exchange databases and transaction logs are not stored on independent disks.
- Mount point volumes.
- Virtual hard disks (VHDs).
 If NetBackup detects any database objects on a VHD, the ASC job fails and no Exchange content is cataloged. This exclusion includes any objects that do not exist on the VHD.
- The ASC job detects an excluded Windows boot disk and treats it like an independent disk.
 The VMware backup cannot exclude for any reason the disk on which NetBackup is installed. For example, do not select the **Exclude boot disk** option if NetBackup is installed on the boot drive (typically C:).

About configuring VMware backups that protect Exchange Server

Use the following steps to configure NetBackup for VMware backups that protect Exchange Server.

Table 8-1 Steps to configure a VMware backup that protects Exchange Server

Step	Action	Description
Step 1	<i>Reviewer: Added this step 5/22/12</i> Configure your VMware environment and add the necessary licenses.	See the <i>NetBackup for VMware Administrator's Guide</i> . <i>Reviewer: Took this from the VMware guide.</i> On each ESX server that hosts the database, add the NetBackup for Exchange license and the Enterprise Client license. Install the NetBackup client software on the virtual machines that have Exchange running. Also install the client on any CAS servers that perform restores.
Step 2	Install the Symantec VSS Provider.	See " Installing the Symantec VSS provider for vSphere " on page 199.

Table 8-1 Steps to configure a VMware backup that protects Exchange Server
(continued)

Step	Action	Description
Step 3	<i>Reviewer: Added 7/20/12</i> If you want to use Replication Director to manage your VMware snapshots and snapshot replicas, special configuration is required.	This feature requires the NetBackup Replication Director license. Perform the following tasks: <ul style="list-style-type: none"> ■ Create a storage lifecycle policy (SLP). See the <i>NetBackup Replication Director Solutions Guide</i>. ■ Configure the NetBackup Client Service with an account that has access to the NetApp filer. See “Configuring NetBackup with access to the CIFS share on the NetApp disk array” on page 207.
Step 4	If you want to restore individual mailbox and public folder items from the VMware backup, review the requirements for granular recovery.	<i>Writer: Create account and services use it. Note RD requires NBU Client Service logon account to NetApp.</i> For Exchange 2010, configure NFS and the NetBackup Client Service on the CAS server and on any clients that are used for browsing. For Exchange 2007, configure NFS and the NetBackup Client Service on any clients that are used to browse or restore. See “ Configuring Granular Recovery Technology (GRT) with a VMware backup that protects Exchange ” on page 200.
Step 5	Configure a VMware policy.	See “ Configuring a VMware policy to back up Exchange Server ” on page 204. See the <i>NetBackup for VMware Administrator's Guide</i> .
Step 6	For Exchange 2007, disable circular logging for all Exchange storage groups. For Exchange 2010, disable circular logging for all databases.	

Installing the Symantec VSS provider for vSphere

Note: You must install the latest version of the Symantec VSS provider. If you have an existing version of the provider, you must first uninstall the old version. Upgrading the NetBackup Client does not upgrade the Symantec VSS Provider.

To use the Symantec VSS provider you must install it manually following installation of the NetBackup for Windows client. If the VMware VSS provider is

installed, the installation program removes it and may require a restart of the computer.

To install the Symantec VSS provider

- 1
- Browse to the following location:
- `install_path\Veritas\NetBackup\bin\goodies\`
- 2
- Double-click on the **Symantec VSS Provider for vSphere** shortcut.
- 3
- Follow the prompts.
- 4
- When the utility has completed, restart the computer if prompted.
- 5
- Following the restart, the utility resumes. Follow the prompts to complete the installation.

To uninstall the Symantec VSS provider

- 1
- In the Control Panel, open **Add or Remove Programs** or **Programs and Features**.
- 2
- Double-click on **Symantec VSS Provider for vSphere**.

The uninstall program does not automatically reinstall the VMware VSS provider.

Configuring Granular Recovery Technology (GRT) with a VMware backup that protects Exchange

This topic includes the steps to configure your NetBackup environment so that you can restore individual Exchange mailbox and public folder objects from a VMware backup.

Reviewer: Changed "Exchange granular clients" to "all Exchange mailbox servers and CAS server".

Table 8-2 Configuring Granular Recovery Technology (GRT) with a VMware backup that protects Exchange

Step	Action	Description
Step 1	Verify that you have a supported Exchange Server configuration and have a media server platform that supports GRT.	See the <i>NetBackup Database Agent Compatibility List</i> . See the <i>NetBackup Operating System Compatibility List</i> .
Step 2	Ensure that requirements are met for the Exchange server software.	See “Exchange server software requirements for NetBackup for Exchange” on page 26.

Table 8-2 Configuring Granular Recovery Technology (GRT) with a VMware backup that protects Exchange *(continued)*

Step	Action	Description
Step 3	<p>All mailbox servers and the CAS Server must meet certain requirements, including the following:</p> <ul style="list-style-type: none"> ■ <i>Reviewer: Updated 10/22/12</i> On each server, have an unassigned drive letter This requirement does not apply if you use Replication Director. ■ Have Network File System (NFS) configured or enabled This requirement does not apply if you use Replication Director. ■ The Exchange credentials (in the Exchange client host properties) are configured. 	<p>To determine which clients to configure, refer to the following topic:</p> <p>See “Exchange granular clients and VMware backups” on page 44.</p> <p>In a cluster or replicated environment, perform the steps on each database node in the cluster. For an Exchange 2010 DAG, perform the steps on each database node in the DAG and the CAS server.</p>
Step 4	On all Exchange mailbox servers and the CAS Server, ensure that each node has an unassigned drive letter on which to mount the backup image.	<p>Note: This requirement does not apply if you use Replication Director.</p>
Step 5	On all Exchange mailbox servers and the CAS Server, enable or configure NFS for your environment.	<p>Note: This requirement does not apply if you use Replication Director.</p> <p>In a cluster or replicated environment, perform the steps on each database node in the cluster. For an Exchange 2010 DAG, configure the nodes that browse for backups and the CAS server. This configuration is not needed to capture the data during backups of the virtual machine.</p> <p>See “About configuring Services for Network File System (NFS) on Windows 2008 and Windows 2008 R2” on page 65.</p> <p>See “About configuring Services for Network File System (NFS) on Windows 2003 R2 SP2” on page 73.</p> <p>See “Configuring a UNIX media server and Windows clients for backups and restores that use Granular Recovery Technology (GRT)” on page 78.</p>

Table 8-2 Configuring Granular Recovery Technology (GRT) with a VMware backup that protects Exchange (*continued*)

Step	Action	Description
Step 6	<p><i>Reviewer: Does the "minimal" account for Exchange 2010 actually have "domain privileged rights"? If not, I will need to rewrite this sentence.</i></p> <p>On all Exchange mailbox servers and the CAS Server, create an Exchange mailbox for NetBackup (or account for NetBackup Exchange operations).</p>	<p>See "About configuring the account for NetBackup Exchange operations" on page 46.</p>
Step 7	<p><i>Reviewer: Updated 2/22/13</i></p> <p>On all Exchange mailbox servers clients and the CAS server, configure the Exchange credentials (in the Exchange client host properties) with the account you created in the previous step.</p> <p>For a VMware backup that uses Replication Director, also configure the NetBackup Client Service with an account that has access to the CIFS shares on the NetApp disk array.</p>	<p>In a cluster or replicated environment, perform the steps on each database node in the cluster. For Exchange 2010, perform the steps on each database node in the DAG and the CAS server.</p> <p>See "Configuring NetBackup with access to the CIFS share on the NetApp disk array" on page 207.</p>
Step 7	<p>Create a policy as follows:</p> <ul style="list-style-type: none"> ■ Select the VMware policy type. ■ Select a supported disk storage unit. 	<p>See <i>Disk Storage Types supported for Granular Recovery Technology (GRT)</i> at the following URL: http://www.symantec.com/docs/TECH187917</p> <p>See "Configuring a VMware policy to back up Exchange Server" on page 204.</p> <p>Granular recovery is automatically provided for any VMware backups that protect Exchange. You do not need to enable it in the policy.</p>
Step 8	<p>(Conditional) Configure the privileges for granular operations.</p>	<p>If you want to perform user-directed granular browse and restore operations, configure the privileges for granular operations. Otherwise, you need to perform granular operations from the server.</p> <p>See "Allowing an Exchange server to browse a backup or to redirect a restore to another server or DAG" on page 83.</p>

Table 8-2 Configuring Granular Recovery Technology (GRT) with a VMware backup that protects Exchange (*continued*)

Step	Action	Description
Step 9	On the NetBackup server, configure the list of Exchange hosts.	<p>For backups in a DAG, cluster, private network, or if you use a proxy host, you must create a mapping of host names in the host properties of the master server. For example, each DAG node and the CAS server must be able to access a backup image using the DAG name.</p> <p>See “Configuring the Exchange hosts for a backup that uses Granular Recovery Technology (GRT)” on page 79.</p>

About configuring VMware policies to protect Exchange Server

To back up an Exchange Server in a virtual machine, you configure a full backup using the **VMware** policy type. Log truncation is optional. Granular Recovery Technology (GRT) is automatically provided in the VMware backup.

Only the details specific to protecting Exchange Server are covered here. For complete details on how to create a VMware policy, see the instructions in the following document:

NetBackup for VMware Administrator's Guide

For NetBackup to successfully truncate logs after a backup, the following apply:

- You must install the Symantec VSS provider.
- The ASC job must detect that the Symantec VSS provider is installed.
- The databases must be active, mounted, not in the exclude list, and protectable. See [“Limitations of using a VMware policy to protect Exchange Server”](#) on page 197.

Note the following when you configure a VMware policy for Exchange Server backups:

- Dismounted databases are not protected.
- You cannot configure an incremental backup of Exchange with a VMware policy. Instead, you must create an MS-Exchange-Server policy for Exchange incremental backups. If you attempt to back up Exchange with a VMware incremental policy, the Application State Capture (ASC) job fails. However, the VMware backup job is successful. Use caution if you use both a VMware

policy for full backups and an Exchange policy for incremental backups. Ensure that the backups are scheduled to occur at distinct times.

- Consistency checks of the Exchange databases are not performed with VMware backups.
- *Reviewer: I deleted the item that most Exchange client host properties do not apply to VMware backups. The user can look at the individual properties to see what applies to which kind of operation.*
- *Reviewer: Lowell said, "Applies to GRT browse and restore of a snapshot copy of the VMware image. Does not apply if you only do database browse and restore, or to any operations on a tar copy of the VMware image." Do you mean that you want me to tell the user that they do not have to configure the Exchange credentials or the NBU Client service UNTIL they do a GRT browse or restore on the snapshot? (or only on the systems that perform GRT browse and restores?)*

For a VMware backup that uses Replication Director, provide the Exchange credentials in the host properties for the Exchange server. Configure the logon account for the NetBackup Client Service with the credentials that can access the NetApp disk array.

See [“About the Exchange credentials in the client host properties”](#) on page 39.

See [“Configuring NetBackup with access to the CIFS share on the NetApp disk array”](#) on page 207.

- GRT is always available in the VMware policy.
- The backup history is not saved for a VMware backup that protects Exchange Server. It does not apply with VMware backups because NetBackup protects only the databases whose active copy is on the virtual machine.
- You may encounter problems if you select **VM hostname** for the **Primary VM identifier**. When you browse for and select the virtual machine for the VMware policy, the appropriate address or client name may not be returned. If this problem occurs, use **VMware display name** instead.

Configuring a VMware policy to back up Exchange Server

This topic describes how to configure a VMware policy to back up Exchange Server. Optionally, you can use NetBackup Accelerator. For log truncation, the Symantec VSS Provider must be installed.

See [“Installing the Symantec VSS provider for vSphere”](#) on page 199.

To configure a VMware policy to back up Exchange Server

- 1 Create a new policy or open the policy you want to configure.
- 2 In the **Policy** dialog box, click the **Attributes** tab.
- 3 In the **Policy type** list, select **VMware**.

For complete details on how to create a policy for VMware backups, see the *NetBackup for VMware Administrator's Guide*.

- 4 To use NetBackup Accelerator, click **Use Accelerator**.

Accelerator uses the initial full backup to establish a baseline. Any subsequent backups that are performed with Accelerator can run significantly faster. More information on Accelerator is available:

See [“About policy attributes for NetBackup for Exchange”](#) on page 95.

See the *NetBackup for VMware Administrator's Guide*.

- 5 On the **Clients** tab click **Select automatically through query**.

If you encounter problems using a query, on the **VMware** tab try changing the **Primary VM identifier** from **VM hostname** to **VMware display name**.

- 6 From the **NetBackup host to perform automatic virtual machine selection** list, select the host you want to use.

- 7 Use the Query Builder to create a rule(s) that selects the virtual machine(s) you want to back up.

For more details on the Query Builder, see the *NetBackup for VMware Administrator's Guide*.

- 8 Click the **Backup Selections** tab.

This tab displays the query you created on the **Clients** tab.

- 9 Click the **VMware** tab.

For details on the options in this dialog box, see the following document *NetBackup for VMware Administrator's Guide*.

- 10 Select the **Primary VM identifier** to use to catalog the backups.

- 11 Select **Enable file recovery from VM backup**.

This option must be enabled for application protection of Exchange Server.

- 12 Enable or disable the **Enable block-level incremental backup** option as follows:

- Enable this option if you selected **Use Accelerator**.
- Disable this option if you do not use NetBackup Accelerator.

13 Select **Enable Exchange Recovery.**

This option enables recovery of the Exchange databases or mailbox messages from the virtual machine backups. If this option is disabled, you can recover the entire virtual machine from the backup, but you cannot recover the databases or mailbox messages individually.

14 (Optional) Select **Truncate logs.**

This option truncates the transaction logs when the VMware snapshot of the virtual machine is complete.

Configuring a VMware policy to back up Exchange Server using Replication Director to manage snapshot replication

Reviewer: Created a new topic for a "replication director" policy.

This topic describes how to configure a VMware policy to back up Exchange Server using Replication Director to manage snapshot replication. Note that NetBackup must have access to the CIFS share on the NetApp disk array. For log truncation, the Symantec VSS Provider must be installed.

See ["Configuring NetBackup with access to the CIFS share on the NetApp disk array"](#) on page 207.

See ["Installing the Symantec VSS provider for vSphere "](#) on page 199.

To configure a VMware policy to back up Exchange Server using Replication Director to manage snapshot replication

- 1** Create a new policy or open the policy you want to configure.
- 2** In the **Policy** dialog box, click the **Attributes** tab.
- 3** In the **Policy type** list, select **VMware**.

For complete details on how to create a policy for VMware backups, see the *NetBackup for VMware Administrator's Guide*.

4 *Reviewer: Updated 1/28/13*

In the **Policy storage** list select the storage lifecycle policy (SLP) that you want to use. This SLP must be configured for snapshot replication.

For complete details on how to configure Replication Director with VMware backups, see the *NetBackup Replication Director Solutions Guide*.

5 *Reviewer: New step 1/28/13*

In the **Snapshot Client and Replication Director** group, click **Use Replication Director**.

- 6 Click the **Clients** tab.
- 7 Click **Select automatically through query**.
If you encounter problems using a query, on the **VMware** tab try changing the **Primary VM identifier** from **VM hostname** to **VMware display name**.
- 8 From the **NetBackup host to perform automatic virtual machine selection** list, select the host you want to use.
- 9 Use the Query Builder to create a rule(s) that selects the virtual machine(s) you want to back up.
For more details on the Query Builder, see the *NetBackup for VMware Administrator's Guide*.
- 10 Click the **Backup Selections** tab.
This tab displays the query you created on the **Clients** tab.
- 11 *Reviewer: Removed mention of Enable file recovery... and Enable block-level since these are disabled when you select Use Replication Director 1/28/13*
Click the **VMware** tab.
For details on the options in this dialog box, see the following document *NetBackup for VMware Administrator's Guide*.
- 12 Select the **Primary VM identifier** to use to catalog the backups.
- 13 Select **Enable Exchange Recovery**.
This option enables recovery of the Exchange databases or mailbox messages from the virtual machine backups. If this option is disabled, you can recover the entire virtual machine from the backup, but you cannot recover the databases or mailbox messages individually.
- 14 (Optional) Select **Truncate logs**.
This option truncates the transaction logs when the VMware snapshot of the virtual machine is complete.

Configuring NetBackup with access to the CIFS share on the NetApp disk array

If you use Replication Director to manage your VMware snapshots and snapshot replication, you must configure the NetBackup Client Service with the account that has access to the CIFS share that are created on the NetApp disk array.

Note the following when you configure the logon account for the NetBackup Client Service:

- Configure each client that performs granular operations. To determine which clients to configure, see the following topics:
See “[Exchange granular clients and non-VMware backups](#)” on page 43.
See “[Exchange granular clients and VMware backups](#)” on page 44.
- In a cluster environment, perform the steps on each database node in the cluster. For Exchange 2010, perform the steps on each database node in the DAG and the CAS server.
- Add the credentials of the account for NetBackup Exchange operations to the Exchange client host properties.
See “[About the Exchange credentials in the client host properties](#)” on page 39.
- You do not need to configure the NetBackup Client Service if you do not use Replication Director to manage your VMware backups.

To configure NetBackup with access to the CIFS shared on the NetApp disk array

- 1 Open the Windows Services application.
- 2 Double-click on the **NetBackup Client Service** entry.
- 3 Click on the **Log On** tab.
- 4 Add the account that has access to the CIFS shares that are created on the NetApp disk array. To change the **Log on as** account, you must have administrator group privileges.

Reviewer: For the NetApp account, what is a good example? Does the user need to provide the domain name?

The account must include the domain name, followed by the user account, **domain_name\account**. For example, **recovery\netbackup**.

- 5 Type the password.
- 6 Click **OK**.
- 7 Stop and start the NetBackup Client Service.
- 8 Close the Services control panel application.
- 9 Open the **Local Security Policy**.
- 10 Click **Local Policies**.
- 11 In the User Rights Assignment, add the account to the **Replace a process level token** policy.
- 12 Run the group policy update command (group policy update) for this change to take effect:

```
gpupdate /Force
```

About restoring Exchange data from a VMware backup

The user restores Exchange data from a VMware backup in the same manner that you restore from a backup that is performed with the Exchange Agent. Though you use a VMware policy type to back up the data, you use the **MS-Exchange-Server** policy type for the restore. NetBackup displays the Exchange data in the VMware backup image that is available for restore.

Note the following when you restore Exchange from a VMware backup:

- You cannot browse or recover granular items (GRT) from GPT disks (GUID partition table).
- *Reviewer: Instead of "tar" changed text to "disk image". Also added requirement to have unassigned drive letter Updated 02/01/13*

If you use Replication Director to create a disk image and want to restore from that image, NFS is required to perform a granular browse and restore. The following requirements apply:

- You must configure NFS on the CAS Server (Exchange 2010) or the client that you use to browse or restore.
- Each node must have an unassigned drive letter on which to mount the backup image.
- All the restore options are available. You can recover to any of the following:
Writer: This is really feature info and should be earlier in the chapter
 - A recovery storage group or recovery database
 - Another storage group or database
 - An alternate server

The target server can be a virtual computer or physical computer.

When you perform a restore, it is important that you select the appropriate source or destination clients. Note the following:

- In some cases the Primary VM identifier in the VMware policy does not match the NetBackup client name that is configured for the VMware host. In this case, you must configure the client to perform a redirected restore.
See [“Allowing an Exchange server to browse a backup or to redirect a restore to another server or DAG”](#) on page 83.
- For a restore of a cluster (including CCR and DAG), select the virtual Exchange server name for the source client. If the client name for the VMware backup used a fully qualified domain name (FQDN), the CCR name or DAG name is also in FQDN format.

- For a restore of an Exchange standalone server, you must select the source client name that NetBackup used for the VMware backup. For example, a particular Exchange Server has the real host name of `Exchangesv1`. You configure a VMware backup policy using the **VMware display name** `Exchange_server1` and perform a backup. When you want to perform a restore, you browse for the backup using the source client name `Exchange_server1`.
- Select a destination client name that NetBackup recognizes. The destination client name must be a network name or computer name. This name must allow NetBackup to connect to the NetBackup client.

See the following topics for information on how to restore Exchange data from a VMware backup:

See [“About restoring Exchange snapshot backups”](#) on page 150.

See [“About restoring individual Exchange mailbox and public folder items”](#) on page 180.

See [“About redirecting a restore of Exchange mailbox or public folder objects to a different path”](#) on page 186.

Enabling protection of passive copies of the Exchange database with VMware backups

For DAG nodes or Exchange 2007 CCR nodes, only the active copies of the database or active servers are cataloged. The passive copies of the databases or passive servers are not cataloged. Log files are not truncated for the passive copies or servers as long as the Symantec VSS Provider is installed.

To protect passive database copies, create the registry value described in the procedure. Set this registry value on one VM in the DAG that serves as the backup server for the DAG. This backup server should have a passive copy of each database in the DAG.

To enable protection of passive copies of the Exchange database with VMware backups

- 1 On the VM that serves as the backup server, open Regedit.
- 2 Open the following key:

`HKEY_LOCAL_MACHINE\SOFTWARE\VERITAS\NetBackup\CurrentVersion\Agents`

- 3 Create a new String Value named **VM_Exchange_Backup_Passive_DBs**.
- 4 Right-click on the new value and click **Modify**.

- 5 In the **Value data** box, type **Yes**.
- 6 Click **OK**.

Recovering an Exchange database to a repaired or an alternate Exchange server

This chapter includes the following topics:

- [About recovery of Exchange databases](#)
- [Recovering an Exchange database](#)

About recovery of Exchange databases

[Table 9-1](#) describes the steps to recover an Exchange database.

Table 9-1 Recovering Exchange databases

Step	Action	Description
Step 1	Repair the Exchange server or create an alternate Exchange server	If you need to recover an Exchange database, you can restore it to a repaired Exchange server or to an alternate Exchange server. For instructions on performing a disaster recovery of an Exchange server, see Table 9-2 .
Step 2	Recover the Exchange database.	See “Recovering an Exchange database” on page 214.

Table 9-1 Recovering Exchange databases (*continued*)

Step	Action	Description
Step 3	Extract mailbox or public folder data to the server.	After you restore to an alternate server, you then can extract mailbox or public folder data to that server. The following article explains how to configure an alternate server for restore operations: http://www.symantec.com/docs/TECH29816

Table 9-2 describes the resources available that describe how to recover an Exchange database.

Reviewer: Do we have instructions for DR of Exchange 2013? 1/31/13

Table 9-2 Instructions for performing a disaster recovery of an Exchange server

Exchange 2010 [http://technet.microsoft.com/en-us/library/dd876880\(EXCHG.140\).aspx](http://technet.microsoft.com/en-us/library/dd876880(EXCHG.140).aspx)

Exchange 2003 *Exchange 2003 Disaster Recovery Operations Guide*
<http://technet.microsoft.com/en-us/library/bb125070.aspx>

All versions of Exchange www.microsoft.com/exchange

See “[Recovering an Exchange database](#)” on page 214.

See “[Prerequisites and operational notes for restoring Exchange individual mailboxes, mailbox folders, public folders, or messages](#)” on page 181.

See “[About restoring Exchange database data](#)” on page 148.

Recovering an Exchange database

To recover an Exchange database

- 1 On an alternate or a repaired Exchange server, create databases (Exchange 2010 or later) or storage groups (Exchange 2007 and earlier) that match the original databases or storage groups.

You can use the Backup, Archive, and Restore interface on the master to view the correct logical names of the databases or storage groups you want to recover.

- 2 Mount and dismount each database store you want to restore.

This action creates the data files NetBackup requires for restore.

- 3 Right-click the database store and click **Properties**.
- 4 On the **Database** tab, click **This database can be overwritten by a restore**.
- 5 Install the NetBackup client software on the alternate or the repaired Exchange server.
- 6 On the master server, open the Backup, Archive, and Restore interface.
- 7 Click **File > Specify NetBackup Machines and Policy Type**.
- 8 In the **Specify NetBackup Machines and Policy Type** dialog box, specify the following:

Server to use for backups and restores	Select the NetBackup server that performed the backup.
Source client for restores	Select the client from which the backup was performed. For a clustered or DAG environment, this client is the virtual DAG name or the virtual cluster name.
Policy type for restores	Select MS-Exchange-Server .
Destination clients for restores	Select the client where you want to direct the restore. This client is either the alternate or the repaired Exchange server.

- 9 Click **OK**.
- 10 Restore the databases and transaction logs.
See [“Restoring storage groups or storage group databases from a streaming backup”](#) on page 175.
- 11 Reconnect the mailboxes you recovered to their Active Directory user accounts.
- 12 If you recovered to an alternate Exchange server, Symantec recommends you restore mailbox data from a backup that used Granular Recovery Technology (GRT).

You can also use a third party tool such as EXMerge to move individual items from an alternate database or an RDB or RSG.

See the Microsoft website for more information about EXMerge.

Troubleshooting backups and restores of Exchange Server

This chapter includes the following topics:

- [About NetBackup for Exchange debug logging](#)
- [Viewing Event Viewer logs on an off-host Exchange server](#)
- [About NetBackup status reports](#)
- [Exchange Server transaction log truncation errors](#)
- [Troubleshooting LCR, CCR, and Database Availability Group \(DAG\) recovery](#)
- [Troubleshooting an Exchange mailbox operation with a status 5 error with bprestore](#)
- [Dynamic enforcement of path length limit for Exchange backups and restores](#)
- [Troubleshooting Exchange snapshot operations](#)
- [Troubleshooting Exchange jobs that use Granular Recovery Technology \(GRT\)](#)
- [About concurrent restore of multiple storage groups](#)
- [Increased memory usage with Exchange 2010](#)
- [Finding the virtual Database Availability Group \(DAG\) node](#)
- [Displaying and resetting the Backup Status for a Database Availability Group \(DAG\)](#)
- [Troubleshooting VMware backups and restores of Exchange Server](#)

About NetBackup for Exchange debug logging

The NetBackup master server and client software offers a comprehensive set of debug logs for troubleshooting problems that can occur during NetBackup operations. Debug logging is also available for Exchange Server backup and restore operations.

See the following topics for information on how to create the logs and how to control the amount of information written to the logs.

See [“Enabling the debug logs for a NetBackup for Exchange client automatically”](#) on page 218.

See [“Debug logs for NetBackup for Exchange backup operations”](#) on page 219.

See [“Debug logs for NetBackup for Exchange restore operations”](#) on page 219.

See [“Setting the debug level on a NetBackup for Exchange Windows client”](#) on page 223.

After you determine the cause of the problem, disable debug logging by removing the previously created debug logging directories. Details are available on the contents of these debug logs.

See the *NetBackup Troubleshooting Guide*.

Additional information about NetBackup client logs and NetBackup master server logs is available.

See the online [help](#) for the Backup, Archive, and Restore interface.

See the *NetBackup Administrator's Guide, Volume I*.

Note: When debug logging is enabled, the files can become large. The same files are used by normal file backups.

Enabling the debug logs for a NetBackup for Exchange client automatically

You can enable debug logging by running a batch file that creates each log directory. To create all log file directories automatically, run the following:

```
install_path\NetBackup\logs\mklogdir.bat
```

Debug logs for NetBackup for Exchange backup operations

After you perform a backup, debug logging information is placed in the `install_path\Netbackup\logs` directory. A subdirectory is created for each process. The debug log file is named `mmdyy.log`.

For details on logging, see the *NetBackup Troubleshooting Guide*.

Snapshot backups

Refer to the following logs:

- `bpbkar`
For off-host backups, the `bpbkar` log exists on the alternate client.
- `bpfis`
For off-host backups, the `bpfis` log exists on the alternate client and the primary client

Backups that use GRT (non-VMware)

Refer to the following logs:

- `bpbkar`
- `nbfsd`
This log appears on the client and the media server.

VMware backups

Refer to the following logs:

- `bpbkar`
- `bpfis`
- `ncfnbcs`
For ASC issues and failures, this log is created on the VM that is backed up.

Exchange 2010 and later backups

Refer to the following logs:

- `bpbkar`
- `bpresolver`
This log is written to the DAG node. To determine the active node, see the following:
See ["Finding the virtual Database Availability Group \(DAG\) node"](#) on page 229.

Debug logs for NetBackup for Exchange restore operations

Reviewer: Rob asked: Should we start mentioning how to get better granular control of `ncflbc` and `ncfgre` logging?

After you perform a restore, debug logging information is placed in the `install_path\Netbackup\logs` directory. A subdirectory is created for each process. The debug log file is named `mmdyy.log`. For legacy logging, the file is named `mmdyy.log`. For unified logging, the log file is in a format that is standardized across Symantec products.

For details on both unified and legacy logging, see the *NetBackup Troubleshooting Guide*.

All restores, except those with Granular Recovery Technology (GRT)

Refer to the following logs:

- *Reviewer: Added 2/1/13*
bpbrm

This log appears on the media server.

- *Reviewer: Added 2/1/13*
bpdbm

- *Reviewer: Added 2/1/13*
bprd

- tar

Restores with GRT

Refer to the following logs:

- beds

- *Reviewer: Added 2/1/13*
bpdbm

- *Reviewer: Added 2/1/13*
bpbrm

This log appears on the media server.

- *Reviewer: Added 2/1/13*
bprd

- nbfsd

Reviewer: Updated 12/20/12

This log appears on the client and the media server. This log does not apply for browse and restore operations from VMware snapshot copies (using Replication Director).

- ncflbc

This log is for nblbc.exe. It appears on the destination client or proxy client.

- ncfgre

This log is for nbgre.exe. It appears on the destination client.

Instant Recovery and off-host Instant Recovery

Refer to the following logs:

- `bpbkar`
For off-host Instant Recovery restores, `bpbkar` logs on the alternate client.
- *Reviewer: Added 2/1/13*
`bpbrm`
This log appears on the master server.
- *Reviewer: Added 2/1/13*
`bpdbm`
- `bpfis`
This log applies to Instant Recovery rollback restores. For off-host Instant Recovery restores, `bpfis` logs exist on both the primary and the alternate clients.
- `bppfi`
For off-host Instant Recovery restores, `bppfi` logs on both the primary and the alternate clients.
- *Reviewer: Added 2/1/13*
`bprd`
- `tar`
For off-host Instant Recovery, this log appears on the primary client.

Exchange 2010 and later restores

Refer to the following logs:

- `bpbkar`
- *Reviewer: Added 2/1/13*
`bpdbm`
- *Reviewer: Added 2/1/13*
`bprd`
- `bpresolver`
This log is written to the DAG node or other destination client, if specified. To determine the active node, see the following:
See [“Finding the virtual Database Availability Group \(DAG\) node”](#) on page 229.

Restores from VMware backups

Refer to the following logs:

- `bpbkar`
- *Reviewer: Added 2/1/13*
`bpdbm`
- `bppfi`
- *Reviewer: Added 2/1/13*
`bprd`
- `tar`

Restores from snapshots
using Replication Director

Reviewer: Added 12/20/12

Refer to the following logs:

■ bpbkar

This log is written to the backup host.

■ *Reviewer: Added 2/1/13*

bpdbm

■ bpfis

■ *Reviewer: Added 2/1/13*

bprd

■ ncfnbhfr

This log is written to the backup host.

■ tar

This log is written to the target Exchange server.

Symantec VSS provider logs

The Symantec VSS provider records its activities in Windows event logs. Debug logs are also available at the following location:

`\Program Files\Symantec\Symantec VSS provider\logs`

Reviewer: Added 12/20/12

Add the registry key as follows to enable Symantec VSS provider logging.

To enable Symantec VSS provider logging in the registry

- 1 Log on as administrator on the computer where NetBackup server is installed.
- 2 Open Regedit.
- 3 Open the following key.:

`HKEY_LOCAL_MACHINE\SOFTWARE\Symantec\Backup Exec for Windows\Backup Exec\Engine\Logging`

- 4 Create a new DWORD value named **CreateDebugLog**.
- 5 Right-click on the new value and click **Modify**.
- 6 In the **Value data** box, enter **1**.
- 7 Click **OK**.

To increase the log debug level modify both the pre-freeze-script.bat and post-thaw-script.bat files. Add the `-log` parameter to the script, at the line where `BeVssRequestor.exe` is called. VMware determines which script is invoked.

To increase the debug level, change the following line in the pre-freeze-script.bat:

```
BeVssRequestor.exe -pre2 -logscreen !SkipExReplica! !SkipSQL!  
!VMBackupType! !ExcludeList!
```

to:

```
BeVssRequestor.exe -pre2 -logscreen !SkipExReplica! !SkipSQL!  
!VMBackupType! !ExcludeList! -log
```

Also change the following line in the post-thaw-script.bat:

```
BeVssRequestor.exe -post2 -logscreen !SkipExReplica! !SkipSQL!  
!VMBackupType! !ExcludeList!
```

to:

```
BeVssRequestor.exe -post2 -logscreen !SkipExReplica! !SkipSQL!  
!VMBackupType! !ExcludeList! -log
```

Setting the debug level on a NetBackup for Exchange Windows client

To control the amount of information that is written to the debug logs, change the General, Verbose, and Database debug levels on the client(s). Typically, the default value of 0 is sufficient. However, technical support may ask you to set the value higher to analyze a problem.

The debug logs are located in *install_path*\NetBackup\logs.

To set the debug level on a NetBackup for Exchange client

- 1 From the Windows Start menu, choose **Programs > Symantec NetBackup > Backup, Archive, and Restore**.
- 2 Select **File > NetBackup Client Properties**.
- 3 Click the **Troubleshooting** tab.
- 4 Set the **General** debug level.
Set this level as high as 2.
- 5 Set the **Verbose** debug level.
Set this level as high as 5.
- 6 Click **OK** to save your changes.

Viewing Event Viewer logs on an off-host Exchange server

During the verification of an off-host backup, Exchange Server logs messages on the off-host server. These logs are helpful if you need to troubleshoot the verification stage of the backup. The application event logs are used for Exchange snapshot backup and restores and for consistency checks. If Exchange Server is not installed on the remote server, you cannot view the details of these logs.

You can view the logs on the remote server in one of the following ways:

- See “[Connecting to the remote Exchange server from within Event Viewer](#)” on page 224.
- See “[About installing the Exchange System Management Tools on the remote server](#)” on page 224.

Connecting to the remote Exchange server from within Event Viewer

You can view the logs on the remote server by opening Event Viewer on a server that has Exchange Server installed. Then connect to the remote computer (the server that performed the off-host backup).

To connect to the remote server from within Event Viewer

- 1 Log in to a server that has Exchange Server installed.
- 2 Open the Event Viewer.
- 3 Click **Actions > Connect to another computer**.
- 4 In the Select Computer dialog box, click **Another computer**.
- 5 Type the name of the remote server or click **Browse** to select the server.
- 6 Click **OK**.
- 7 In the left-hand pane, click Application to view the Exchange logs related to the off-host backup.

About installing the Exchange System Management Tools on the remote server

To install the Exchange System Management Tools, refer to the following articles:

- On the Microsoft Support website, refer to article 834121:
<http://support.microsoft.com>
- On the Microsoft TechNet website, refer to the Administration Guide for Exchange Server 2003:

<http://technet.microsoft.com>

About NetBackup status reports

NetBackup provides many standard status reports to verify the completion of backup and restore operations. In addition, users and the administrator can set up additional reports if a site requires them.

The administrator has access to operational progress reports through the NetBackup Administration Console. Reports can be generated for Status of Backups, Client Backups, Problems, All Log Entries, Media Lists, Media Contents, Images on Media, Media Logs, Media Summary, and Media Written. These reports can be generated for a specific time frame, client, or master server.

See the *NetBackup Administrator's Guide, Volume I* for details.

Progress reports on the client allow easy monitoring of user operations. When reports are created by the NetBackup client for each user-directed backup or restore operation, administrators can monitor these operations and detect any problems that may occur.

See “[Viewing the progress report of a NetBackup for Exchange operation](#)” on page 225.

Viewing the progress report of a NetBackup for Exchange operation

This topic describes how to view the progress report of a NetBackup for Exchange backup or restore operation.

To view the progress report of a NetBackup for Exchange operation

- 1 Choose **File > View Status**.
- 2 Click the task for which you want to check the progress.
- 3 Click **Refresh**.

More information is available on progress reports and the meaning of the messages.

See the *NetBackup Backup, Archive, and Restore Getting Started Guide*.

Exchange Server transaction log truncation errors

The Exchange server deletes transaction logs after a successful backup (for full and differential backup types). If the Exchange server encounters any errors during the deletion process, it logs this information in the application event log. Since the actual backup was successful, NetBackup exits with a status 0 (successful

backup). Refer to the Microsoft Exchange Server documentation for information on any errors that are encountered with the transaction logs.

Troubleshooting LCR, CCR, and Database Availability Group (DAG) recovery

If you restore a backup which included only uncommitted logs, Exchange may report an error similar to the following:

```
Event Type:      Error
Event Source:    MSExchangeRepl
Event Category:  Service
Event ID:        2059
```

Refer to the following article for information on how to resolve this issue:

<http://www.symantec.com/docs/TECH88101>

Troubleshooting an Exchange mailbox operation with a status 5 error with bprestore

If you start an Exchange mailbox restore operation with the `bprestore` command and encounter a status 5 error, check that the path is correct. The `bplist` command does not properly escape the “[” and “]” characters.

For example, `bplist` returns the following path for a mailbox:

```
/Microsoft Information Store/SG1/Mailbox1/backrest100 [backrest100]/
```

Instead, edit the path so it appears as follows:

```
/Microsoft Information Store/SG1/Mailbox1/backrest100 \"[backrest100]\"/
```

Note: For VMware backups and restores, you need only configure the systems that browse for backups and the CAS server. This configuration is not needed to capture the data during backups of the virtual machine.

Dynamic enforcement of path length limit for Exchange backups and restores

The *NetBackup Administrator's Guide for Windows, Volume I* details that files and directories with path lengths greater than 1023 are automatically excluded

from backups. For Exchange MAPI mailbox backups and for GRT-enabled backups, the path length limit applies to individual mailbox folders and messages. When a legacy mailbox backup encounters an item that exceeds the limit, the backup job reports a final status of 1. This status indicates that some items were not backed up, and the job details tell you which items were skipped. For granular backups NetBackup checks the pathname length limit and reports exceptions, during browsing and restoring of the granular backup image. It logs the pathnames that exceed the limit in the unified logging `ncflbc` or `ncfgre` logs. Then it reports the items that were skipped during restore to the **View Status** window.

Troubleshooting Exchange snapshot operations

Note the following when you perform Exchange snapshot backup or restore operations:

- If you want to restore a snapshot backup from a multiplexed tape, restore the entire storage group. If you attempt to restore a single database from a storage group that contains multiple databases, the restore may fail. This issue will be fixed in a future release.
- If you want to restore from a snapshot image, the restore fails if an `Exxrestore.env` file exists in the transaction log folder for the database or the storage group. This temporary Exchange file can be left from a previously failed restore. A Windows application event log entry from Exchange tells you that this file is the problem. Remove this file manually before you attempt another restore.
- When you launch an Exchange off-host backup from the Backup, Archive, and Restore interface or from a node in a DAG, the progress log window does not display the usual progress messages as when a scheduled backup is executed. This lack of progress logging does not affect the backup operation. If you want detailed progress, use the NetBackup Administration Console to launch a manual backup operation of the Exchange policy.
 See [“Performing a manual backup for an MS-Exchange-Server policy”](#) on page 136.

Troubleshooting Exchange jobs that use Granular Recovery Technology (GRT)

Note the following when you use NetBackup to perform backup or restore operations using Granular Recovery Technology:

- Disable or uninstall QLogic SANSurfer software. It may conflict with the portmapper for Client for NFS.
- Before you install NFS on the media server or client(s), look for the ONC/RPC Portmapper service. If it exists, stop it and disable it. Otherwise, the installation of NFS Services for Windows fails.
- A status 1 error may occur for a GRT-enabled backup if the granular processing operations failed to complete successfully. The job details under the Activity Monitor or error log should indicate if this failure is what caused the status 1. Do the following:
 - Look at the bpbkar debug log for more information.
 - A streaming backup still truncates transaction logs if the job ended with a status 1 because of a granular processing operation failure. In this situation, the backup image is suitable for database recovery.
- NetBackup must be able to contact the proxy host (if applicable) or destination client.

If NetBackup cannot contact this client, then errors appear in the “Problems” or “All Log Entries” reports. The following error messages appear in the NetBackup error logs:

The granular proxy <clientname> for client <clientname> could not be contacted. Unexpected results may have occurred. See bprd debug log for more details.

Could not connect to <clientname> for virtual browse operation, errno=#,
bpcd_status=#

See [“Exchange granular clients and non-VMware backups”](#) on page 43.

- Technical Support may want nbfsd logs from the media server. Use the Verbose setting carefully as the nbfsd log can grow very large.

About concurrent restore of multiple storage groups

When you use multiple backup streams, for example, one stream for each storage group, only the last storage group restored from the last restore job is properly mounted. Recovery of the remaining storage groups is not complete.

Take one of these corrective actions:

- If you want to restore from a snapshot backup, simply mount the unmounted storage groups.

- If you want to restore from a legacy (non-snapshot) backup, restore the logs from the last backup set for each storage group individually.

To avoid these steps, you can also restore the storage groups individually in separate restore operations.

Increased memory usage with Exchange 2010

Reviewer: Does this issue exist for Exchange 2013? 1/11/13

As you increase the number of mailbox users with Exchange 2010, `MONAD.EXE` uses more memory during backup operations. Symantec is working with Microsoft to fix this problem.

Finding the virtual Database Availability Group (DAG) node

Finding the virtual Database Availability Group (DAG) node

- 1 Start **Programs > Administrative Tools > Failover Cluster Management** on one of the Exchange DAG servers.
- 2 In the left pane, select the DAG.
- 3 In the right pane, under **Summary of Cluster**, locate **Current Host Server**.
 This server is where the virtual DAG resides.

Displaying and resetting the Backup Status for a Database Availability Group (DAG)

Use the following commands to display and reset the Backup Status for a DAG. More information is available about how the Backup Status is used to choose the node from which to perform the backup.

See [“Backup status for Exchange Database Availability Groups \(DAGs\) and the preferred server list”](#) on page 121.

Note: `-EXDB` is case sensitive

To display the Backup Status database, enter one of the following commands from the NetBackup master server:

```
bpclient -client host_name -EXDB
```

```
bpclient -All -EXDB
```

where *host_name* is the name of the DAG. The output from this command is as follows:

EX_DB: DAG_DB3	EX_SRVR: EXSRV3	EX_TIME: 1259516017	EX_COUNT: 1	EX_STATUS: 156
EX_DB: DAG_MBOX7	EX_SRVR: EXSRV3	EX_TIME: 1259516040	EX_COUNT: 2	EX_STATUS: 0
EX_DB: EXCHDB001	EX_SRVR: EXSRV2	EX_TIME: 1259516018	EX_COUNT: 1	EX_STATUS: 0

Note: `-exdb` is case sensitive

To reset the Backup Status database for a particular Exchange database, enter the following command:

```
bpclient -client host_name -update
-exdb <db_name:server_name[:timestamp:count:status]>
```

For example:

```
bpclient -client DAG_Name -update -exdb DAG_DB3:EXSRV1:0:0:0
```

Troubleshooting VMware backups and restores of Exchange Server

One Application State Capture job is created per VM, regardless of which applications are selected in policy.

Note the following when you perform a VMware backup that protects an application:

- The ASC job can fail if the VMware disk layout has changed since the last discovery. In this situation, you must force NetBackup to rediscover virtual machines by lowering the value of the **Reuse VMselection query results for** option. See the *NetBackup for VMware Administrator's Guide*.
- If the ASC job fails, the VMware snapshot or backup continues. Application-specific data cannot be restored. When you query the SQL Server Management Studio (SSMS), it may show that the database was backed up. In this case, though the database was skipped, the snapshot was still successful.
- Failure results in the discovery job or parent job exiting with status 1.
- ASC messages are filtered to the ASC job details.

- If you enable recovery for a particular application but that application does not exist on the VM, the ASC job returns Status 0.
- Details on the ASC job can be found in the Activity monitor job details.
- If neither the Symantec nor the VMware VSS Provider is installed at the time of backup, the Exchange databases are not quiescent. In this case, the recovery of an Exchange database after it is restored may require manual steps using the Exchange `ESEUTIL` utility.
- `bpfis` is executed and simulates a VSS snapshot backup. This simulation is required to gain logical information of the application.

DRAFT

Configuring mailbox and public folder operations (Exchange 2007 and Exchange 2003)

This appendix includes the following topics:

- [About Exchange mailbox and public folder operations with MAPI](#)
- [About configuring the account for NetBackup Exchange operations for mailbox and public folder operations](#)
- [Configuring the logon account for the NetBackup Client Service for mailbox and public folder operations](#)
- [About configuring Exchange Single Instance Store backups \(Exchange 2007\)](#)
- [Policy recommendations for Exchange Server 2007 mailbox or public folder backups \(with MAPI\)](#)
- [Configuring a policy for backups of individual Exchange mailboxes or public folders \(Exchange 2007\)](#)
- [Adding backup selections to an Exchange policy for mailbox and public folder backups \(Exchange 2007\)](#)
- [Notes and limitations when you create a backup selections list for mailbox and public folder backups \(with MAPI\)](#)
- [About excluding Exchange items from mailbox and public folder backups \(Exchange 2007\)](#)

- Configuring exclude lists for Exchange clients in mailbox and public folder backup policies
- Using wildcards in an Exchange backup selections list for mailbox or public folder backups
- Performing user-directed backups of individual mailboxes and public folders with MAPI (Exchange 2007)
- Restoring Exchange mailbox or public folder objects from mailbox or public folder backups
- Redirecting mailbox or public folder object from a mailbox backup
- Debug logs for NetBackup for Exchange mailbox and public folder backup and restore operations

About Exchange mailbox and public folder operations with MAPI

Reviewer: Added 11/30/12

Mailbox and public folder operations are performed with MAPI. This type of backup is only available with Exchange 2007 and requires the use of a specific directive in the backup policy. This type of restore is only available with Exchange 2007 and 2003.

Symantec recommends that you perform streaming or snapshot backups. Mailbox and public folder backups allow for mailbox or public folder recovery, but are not adequate for disaster recovery. Exchange database backups are required for disaster recovery. Backup with Granular Recovery Technology (GRT) enabled can replace mailbox and public folder backups.

About configuring the account for NetBackup Exchange operations for mailbox and public folder operations

Reviewer: I split the MAPI specific information into it's own topic here. 10/22/12

NetBackup must have access to Exchange mailboxes and public folders so it can do the following:

- Enumerate mailboxes when defining a policy.
- Perform backups of mailbox and public folder objects with MAPI (Exchange 2007).

- Perform restores of mailbox and public folder objects with MAPI (Exchange 2007 and earlier).

NetBackup gains access to Exchange through a unique Exchange mailbox that has permissions to perform backups and restores. This mailbox is referred to as the account for NetBackup Exchange operations. Configure this account on all Exchange mailbox servers and for any environment where you perform mailbox operations, including clustered or replicated environments.

Reviewer: ET3064051 Added 1/30/13

By default, the NetBackup Client Service uses “Local System” for the logon account. The “Local System” account lacks sufficient rights to execute remote PowerShell calls to enumerate the Exchange environment. Configure the logon account for the NetBackup Client Service with the credentials for the NetBackup Exchange operations account.

Table A-1 Steps to configure the account for NetBackup Exchange operations for mailbox backups and restores

Step	Action	Description
Step 1	On all the Exchange mailbox servers, create an Exchange mailbox for NetBackup.	<p>Configure the account for NetBackup Exchange operations as follows:</p> <ul style="list-style-type: none"> ■ Symantec recommends that you create a uniquely named mailbox. Verify that this mailbox is not hidden. ■ Ensure that the account has domain privileged rights. ■ Refer to the following procedure: See “Configuring the account for NetBackup Exchange operations (Exchange 2007)” on page 52. See “Configuring the account for NetBackup Exchange operations (Exchange 2003)” on page 54.
Step 2	On all Exchange mailbox servers, configure the logon account for the NetBackup Client Service.	See “ Configuring the logon account for the NetBackup Client Service for mailbox and public folder operations ” on page 236.

Configuring the logon account for the NetBackup Client Service for mailbox and public folder operations

Note:

Reviewer: ET3064051 Added 1/30/13

NetBackup 7.6 contains a new option that is called **Exchange credentials** in the Exchange client host properties. This property does not apply to mailbox and public folder operations. For these operations, you must use the Exchange credentials as the logon account for the NetBackup Client Service.

By default, the NetBackup Client Service uses “Local System” account to log on. A different account is required for mailbox and public folder (MAPI) operations so that NetBackup has permissions to perform Exchange backups and restores. See the following topics for information on how to create this account.

See [“Configuring the account for NetBackup Exchange operations \(Exchange 2007\)”](#) on page 52.

See [“Configuring the account for NetBackup Exchange operations \(Exchange 2003\)”](#) on page 54.

Note the following:

- For mailbox and public folder operations with MAPI, configure the NetBackup Client Service on all Exchange mailbox servers.
- In a cluster environment, perform the steps on each database node in the cluster.

■ *Reviewer: ET2663714 8/17/12*

If you use NetBackup for Exchange on a SAN client, use the same account for the NetBackup Client Service and the SAN Client Fibre Transport Service. Alternatively, you can provide the Exchange credentials in the client host properties. In that case, you do not need to use the same credentials for the SAN Client Fibre Transport Service.

To configure the logon account for the NetBackup Client Service for mailbox and public folder operations

- 1 Open the Windows Services application.
- 2 Double-click on the **NetBackup Client Service** entry.
- 3 Click on the **Log On** tab.

- 4 Provide the credentials for the account for NetBackup Exchange operations. To change the **Log on as** account, you must have administrator group privileges.

The account must include the domain name, followed by the user account, **domain_name\account**. For example, **recovery\netbackup**.
- 5 Type the password.
- 6 Click **OK**.
- 7 Stop and start the NetBackup Client Service.
- 8 Close the Services control panel application.

About configuring Exchange Single Instance Store backups (Exchange 2007)

Reviewer: Removed Exchange 2003 8/2/12

Exchange Server 2007 uses the Single Instance Store (SIS) to maintain single-instance storage of mail messages. This capability in Exchange Server allows the database to keep one copy of a message sent to multiple users on the same server.

To back up the data that is stored on an SIS volume, select **Enable single instance backup for message attachments**. Enable this option in the Exchange properties for the NetBackup client where Exchange Server is installed.

See [“Configuring Exchange client host properties”](#) on page 31.

Note the following:

- This feature is only available for MAPI mailbox backups, not for snapshot backups or any backups that use Granular Recovery Technology (GRT).
- Only attachments larger than 100 KB are backed up as SIS objects. Attachments smaller than 100 KB are backed up with each individual message.

Policy recommendations for Exchange Server 2007 mailbox or public folder backups (with MAPI)

Refer to the following policy recommendations for Exchange 2007 mailbox or public folder backup:

- Create a policy that backs up mailbox objects. This policy supports full, incremental, and user-directed backups. (In [Table A-2](#).)

- Create a policy that backs up public folder objects. This policy supports full, incremental, and user-directed backups. (In [Table A-3](#).)
- The **Enable granular recovery** and **Perform snapshot backups** options are not applicable for mailbox and public folder backups.
- You can create multiple data streams at the mailbox or public folder level. See [“Using wildcards in an Exchange backup selections list for mailbox or public folder backups”](#) on page 244.
- The example policies include the basic policy settings for an Exchange backup. For more information on how to create policies, see the following:
See [“Configuring a policy for backups of individual Exchange mailboxes or public folders \(Exchange 2007\)”](#) on page 239.
- In NetBackup 7.6, mailbox and public folder backups (with MAPI) are not supported with Exchange 2003 or Exchange 2010 or later.

Table A-2 NetBackup policy example for an Exchange Server 2007 mailbox backup

Policy item	Configuration
Policy type	MS-Exchange-Server
Backup selections	Microsoft Exchange Mailboxes:\
Auto backup frequency	Weekly Full Daily Incremental
Other configuration	A backup of all mailboxes may not complete within the backup windows. Consider adding smaller groups of mailboxes to multiple policies. Perform snapshot backups and Enable granular recovery are not applicable for mailbox backups.

Table A-3 NetBackup policy example for an Exchange Server 2007 public folder backup

Policy item	Configuration
Policy type	MS-Exchange-Server
Backup selections	Microsoft Exchange Public Folders:\
Auto backup frequency	Weekly Full Daily Incremental

Table A-3 NetBackup policy example for an Exchange Server 2007 public folder backup (*continued*)

Policy item	Configuration
Other configuration	Perform snapshot backups and Enable granular recovery are not applicable for public folder backups.

Configuring a policy for backups of individual Exchange mailboxes or public folders (Exchange 2007)

A mailbox or public folder policy includes individual mailbox or public folder objects. This type of policy can only be configured for Exchange 2007. Before you configure NetBackup for Exchange policy for these objects, review the configuration that is necessary for this type of backup.

See [“About configuring the account for NetBackup Exchange operations”](#) on page 46.

To configure a NetBackup for Exchange policy for mailbox or public folder backups

- 1 Log on to the master server as administrator.
- 2 Start the NetBackup Administration Console.
- 3 If your site has more than one master server, choose the one on which you want to add the policy.
- 4 In the NetBackup Administration Console, select **NetBackup Management > Policies**. Then select **Actions > New > New Policy**.
- 5 In the **Add a New Policy** dialog box, in the **Policy name** box, type a unique name for the new policy.
- 6 Click **OK**.
- 7 In the **Add New Policy** dialog box, in the **Policy type** list, select **MS-Exchange-Server**.

The database agent policy type does not appear in the drop-down list unless your master server has a license key for the database agent.

- 8 Complete the entries on the **Attributes** tab.

See [“About policy attributes for NetBackup for Exchange”](#) on page 95.

- 9 Add other policy information as follows:

- Add schedules.

See [“Adding schedules to a NetBackup for Exchange policy”](#) on page 97.

- Add clients.
See “[Adding clients to a NetBackup for Exchange policy](#)” on page 100.
- Add database objects to the backup selections list.
See “[Adding backup selections to an Exchange policy](#)” on page 101.
See “[Notes and limitations when you create a backup selections list for mailbox and public folder backups \(with MAPI\)](#)” on page 241.
See “[Policy recommendations for Exchange Server 2007 mailbox or public folder backups \(with MAPI\)](#)” on page 237.

10 When you have added all the schedules, clients, and backup selections you need, click **OK**.

Adding backup selections to an Exchange policy for mailbox and public folder backups (Exchange 2007)

The backup selections list defines the Exchange objects to back up and the grouping of Exchange objects for multiple data streams. Exchange objects are defined through directives. You can append an individual object name to a directive to specify a mailbox or public folder. You can use wildcards to specify a group of such objects.

Note: In a backup policy, include directives from only one directive set. For example, do not add `Microsoft Information Store:\` and `Microsoft Exchange Mailboxes:\` or `Microsoft Exchange Public Folders:\` to the same policy.

The following directives exist for mailbox and public folder backups:

Table A-4 NetBackup for Exchange Server directive sets and directives for mailbox and public folder backups

Directive set	Directive(s)	Notes
MS_Exchange_Mailbox	NEW_STREAM Microsoft Exchange Mailboxes:\	Only supported for Exchange 2007. See “ Notes and limitations when you create a backup selections list for mailbox and public folder backups (with MAPI) ” on page 241. See “ About excluding Exchange items from backups ” on page 106.

Table A-4 NetBackup for Exchange Server directive sets and directives for mailbox and public folder backups *(continued)*

Directive set	Directive(s)	Notes
MS_Exchange_Public_Folders	NEW_STREAM Microsoft Exchange Public Folders:\	Only supported for Exchange 2007. See “Notes and limitations when you create a backup selections list for mailbox and public folder backups (with MAPI)” on page 241. See “About excluding Exchange items from backups” on page 106.

Refer to the following topics when you add backup selections:

- See [“Adding Exchange entries to a backup selections list by browsing \(Windows only\)”](#) on page 102.
- See [“Adding Exchange entries to the backup selections list manually”](#) on page 103.
- See [“Performing Exchange backups with multiple data streams”](#) on page 103.
- See [“About excluding Exchange items from backups”](#) on page 106.

Notes and limitations when you create a backup selections list for mailbox and public folder backups (with MAPI)

Mailbox backups are performed with the `Microsoft Exchange Mailboxes:\` directive. Public folder backups are performed with the `Microsoft Exchange Public Folders:\` directive.

Review the following information before you create a backup selections list for mailbox or public folder backups:

- To perform backups of mailboxes, additional steps are required beyond policy configuration.
See [“About configuring the account for NetBackup Exchange operations”](#) on page 46.
- When you use mailbox or public folder directives, only backups of mailboxes or folders are allowed. You cannot specify the backup of an individual message or individual public document.
- The root path of an Exchange Mailbox object (`Microsoft Exchange Mailboxes:\`) is case-sensitive.

See “Policy recommendations for Exchange Server 2007 mailbox or public folder backups (with MAPI)” on page 237.

About excluding Exchange items from mailbox and public folder backups (Exchange 2007)

If you do not want to back up certain mailboxes or public folders, you can create an exclude list. When NetBackup runs a NetBackup for Exchange backup policy, NetBackup ignores the items that appear in the exclude list.

For more information on how to create an exclude list by using the NetBackup Administration Console, see one of the following:

- See “Configuring exclude lists for Exchange clients” on page 107.
- The *NetBackup Administrator’s Guide, Volume I*.

NetBackup excludes certain files and directories by default. These default exclusions always appear in the Administration Console’s exclude list. The default exclusions are as follows:

- C:\Program Files\Veritas\NetBackup\bin\bprd.d*.lock
- C:\Program Files\Veritas\NetBackup\bin\bpsched.d*.lock
- C:\Program Files\Veritas\NetBackupDB\data*
- C:\Program Files\Veritas\Volmgr\misc*

Table A-5 provides examples of Exchange mailbox entries you can add to an exclude list.

Table A-5 Example Exchange mailbox entries in an exclude list

This entry ...	excludes ...
Microsoft Exchange Mailboxes:\J*	All mailboxes with a name that starts with “J”.
Microsoft Exchange Mailboxes:\Joe Smith\ Microsoft Exchange Mailboxes:\Joe Smith [JoeS]\	The mailbox “Joe Smith” or “Joe Smith [JoeS]” with a name that starts with “Joe Smith”.
Microsoft Exchange Mailboxes:\Joe Smith*\Top of Information Store\Deleted Items	The Deleted Items folder for the mailbox “Joe Smith”.
Microsoft Exchange Mailboxes:*\Top of Information Store\Inbox\SPAM*	Any messages that begin with “SPAM” in the user’s “Inbox”.

Table A-6 provides examples of public folder entries you can add to an exclude list.

Table A-6 Example public folder entries in an exclude list

This entry ...	excludes ...
Microsoft Exchange Public Folders:\Marketing	The root public folder called "Marketing".
Microsoft Exchange Public Folders:\Marketing*.xls	All .xls documents under the Public Folder called "Marketing".

Configuring exclude lists for Exchange clients in mailbox and public folder backup policies

This topic describes how to exclude items from an Exchange backup. For more information about this topic, see the following:

See [“About excluding Exchange items from mailbox and public folder backups \(Exchange 2007\)”](#) on page 242.

The following figure shows an exclude list with two databases:

Note: For backups in a clustered environment, select each node and perform the configuration procedure on each node. You must configure the same settings on each node. If you change the attributes for the virtual name of the client, NetBackup updates only the active node or current node.

To configure an Exchange client exclude list in mailbox and public folder backup policies

- 1 Open the NetBackup Administration Console or the Remote Administration Console.
- 2 In the left pane, expand **NetBackup Administration > Host Properties > Clients**.
- 3 In the right pane, select the Exchange client(s) that you want to configure.
- 4 Click **Actions > Properties**.
- 5 Expand **Windows Client** and click **Exclude Lists**.
- 6 Click **Add**.
- 7 Specify objects to exclude in one of the following ways:

- In the **Policy** field, select <<All Policies>> or type the name of a specific policy.
- In the **Schedules** field, select <<All Schedules>> or type the name of a specific schedule.
- In the **Files/Directories** field, type the name of a storage group, database in the following format:
`Microsoft Exchange Mailboxes:\J*`

Using wildcards in an Exchange backup selections list for mailbox or public folder backups

Wildcard characters can be used to define groups of mailboxes or public folders. This way multiple objects can be backed up without having to specify the objects individually in the backup selections list. Multiple data streams must also be enabled. If this feature is not enabled, the backup fails.

See [“Performing Exchange backups with multiple data streams”](#) on page 103.

Table A-7 Supported wildcard characters for mailbox and public folder backups

Wildcard character	Action
Asterisk (*)	Use as a substitute for zero or more characters. Specify the asterisk as the last character in the string. Example: To specify all objects that start with an a use a*.
Question mark (?)	Use as a substitute for one or more characters in a name. Example 1: The string s?z processes all objects that have s for a first character, any character for a second character, and z for a third character. Example 2: The string Data??se processes all objects that have Data as the first four characters, any characters for the fifth and sixth characters, and se as the seventh and either characters.

Table A-7 Supported wildcard characters for mailbox and public folder backups
(continued)

Wildcard character	Action
Left & right brackets ([...])	<p>Use to match any one character that is enclosed in square brackets. A minus (–) can be used to indicate a range of consecutive characters; for example, [0-9] is equivalent to [0123456789].</p> <p>Note: The minus (–) loses this special meaning if it occurs last in the string.</p> <p>Note: The right square bracket (]) does not terminate such a string when it is the first character within it. For example, [] a–f] matches either a right square bracket (]) or one of the ASCII letters a through f inclusive. Asterisk (*) and Question Mark (?) stand for themselves within such a string of characters.</p>

The following rules apply when wildcard characters are used in the backup selections list:

- Only one wildcard pattern per backup selections list entry is allowed.
- If a wildcard pattern is not honored it is treated literally.
- Wildcard patterns are honored only in the final segment of the path name.

Correct

```
Microsoft Exchange Mailboxes:\John Anderson [janderson]\Top of Information Store\*
```

Incorrect

```
Microsoft Exchange Mailboxes:\John Anderson [janderson]\*\Inbox
```
- For an Exchange Mailboxes path: Any segment of the path can contain wildcard characters as long as the wildcard characters are the last characters in the segment. These segments include mailbox names, folders, or messages within the mailbox hierarchy.

Correct

```
Microsoft Exchange Mailboxes:\John Anderson [janderson]\Top of Information Store\*
Microsoft Exchange Mailboxes:\John Anderson [janderson]\Top of Information Store\[a-h]*
```

Incorrect

```
Microsoft Exchange Mailboxes:\[a-h]*\Top of Information Store
Microsoft Exchange Mailboxes:\John Anderson [janderson]\Top*\
```

- For Exchange public folders: Any segment of the path can contain wildcard characters as long as the wildcard characters are the last characters in the segment. These segments include workspace names or workspace folders.

Correct

```
Microsoft Exchange Public Folders:\Folder1\Subfolder?
```

Incorrect

```
Microsoft Exchange Public Folders:\Folder?\Subfolder1
```

```
Microsoft Exchange Public Folders:\*\Subfolder1
```

Performing user-directed backups of individual mailboxes and public folders with MAPI (Exchange 2007)

Reviewer: Removed Exchange 2003 from title 8/2/12

Before you perform backups of individual Exchange mailboxes or public folders, special configuration is required.

See [“About configuring the account for NetBackup Exchange operations for mailbox and public folder operations”](#) on page 234.

Note: The user account you use to log on must have the same Exchange privileges as the account for NetBackup Exchange operations.

To back up individual mailboxes, mailbox folders, or public folders, the backup policy must include the `Microsoft Exchange Mailboxes:\` or the `Microsoft Exchange Public Folders:\` directive.

Alternatively, you can perform a user-directed backup from a database backup policy that has **Enable granular recovery** enabled. You cannot back up individual mailboxes, mailbox folders, or public folders with a database backup policy. However, you can restore these items from the database backup.

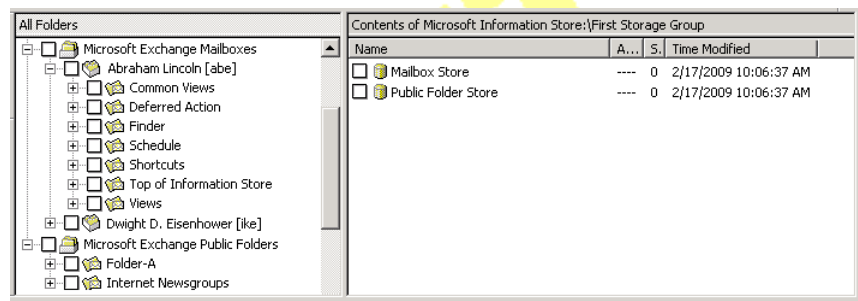

See [“Performing user-directed streaming backups of Exchange Server \(Exchange 2007\)”](#) on page 141.

See [“Performing user-directed snapshot backups of Exchange Server”](#) on page 139.

To perform a user-directed backup of individual mailboxes and public folders with MAPI

- 1 Log onto the server as Administrator.
- 2 Open the Backup, Archive, and Restore interface on the Exchange Server.

- 3 Click **File > Select Files and Folders to Back Up**.
- 4 Select **File > Specify NetBackup Machines and Policy Type**.
- 5 In the **Specify NetBackup Machines and Policy Type** dialog box, provide the following information:
 - The server you want to perform the backup.
 - If you are in a cluster environment, specify the name of the virtual Exchange Server name.
See [“About selecting a source client for an Exchange Server backup operation”](#) on page 138.
- 6 In the **All Folders** pane, expand the node that contains the objects you want to back up and select those objects.
See [Table A-8](#) on page 247.

- 7 Click **Actions > Backup**.
- 8 Select the backup options you want.
See [“Options for user-directed Exchange backups”](#) on page 139.
- 9 Click **Start Backup**.
- 10 To view the progress of the backup, click **Yes**.
If you do not want to view the progress of the backup, click **No**.

Table A-8 Selecting individual Exchange mailboxes and public folders for user-directed backups

Node	Select
Microsoft Exchange Mailboxes	Mailbox(es)
	Mailbox folder(s)
Microsoft Exchange Public Folders	Public folder(s)

Restoring Exchange mailbox or public folder objects from mailbox or public folder backups

To restore a mailbox object to a different location, you follow a different procedure.

See [“About redirecting a restore of Exchange mailbox or public folder objects to a different path”](#) on page 186.

Note the following:

- When a mailbox is restored, all folders and messages that are contained in the mailbox are restored. You can choose to restore specific folders or messages or both from the mailbox backup image.
- When a folder is restored, all subfolders and messages that are contained in the folder are restored. You also can choose to **restore** specific subfolders or specific messages or both from the folder backup image.
- Do not restore mailbox or public folder backups and database backups in the same restore job. If the database restore starts first, NetBackup dismounts the database during the restore. Or it **requires that** the database be dismounted before the restore. Then the database being dismounted causes the mailbox or public folder object restore to fail. Or, the restore of the Exchange mailbox or public folder items finishes before the restore of the Exchange databases starts. Then the restore of the Exchange databases deletes the restored mailbox or public folder objects.

To restore mailbox or public folder objects from mailbox or public folder backups

- 1 Log onto the server as Administrator.
- 2 Open the Backup, Archive, and Restore interface.
- 3 Click **File > Select Files and Folders to Restore > from Normal Backup**.
- 4 Click **File > Specify NetBackup Machines and Policy Type**.
- 5 In the **Specify NetBackup Machines and Policy Type** dialog box, select the server and the policy type.
- 6 From the **NetBackup History** pane, click the image(s) that contain the objects you want to restore.

Symantec recommends that you select one backup image set at a time for individual item restore. While this recommendation is not a restriction, you may at times restore more copies of messages than you intend.

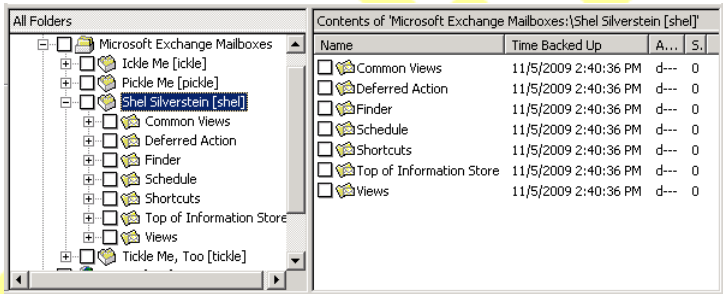

Select one of the following:

- The last full backup
- The last full backup and all subsequent differential backups

- The last full backup and the last cumulative backup
- 7 Expand one of the following:
- **Microsoft Exchange Mailboxes**
 - **Microsoft Exchange Public Folders**
- 8 In the **All Folders** pane, select objects you want to restore from the following:
- Mailboxes
 - Mailbox folders
 - Mailbox objects
 - Public folders
 - Documents in a public folder

You can ignore the `DLLs` folder.

The following figure shows a mailbox restore.

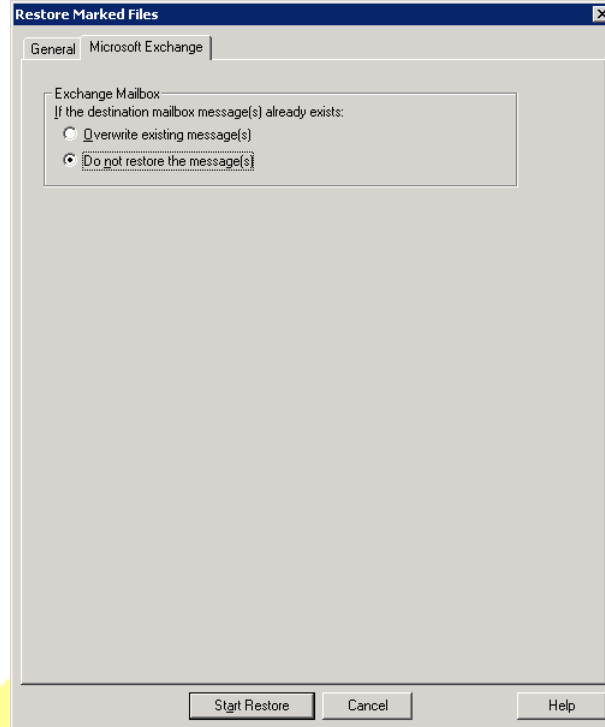

All objects appear as folders and messages. You can identify some non-message objects by the subject line. For example, if you create a Calendar event named Appointment1, that name appears in the subject line for that object.

However, some objects such as Forms and Views do not have a subject line (even though they can be named). They may not be so easily identified.

- 9 Click **Actions > Restore**.

- 10** On the **Microsoft Exchange** tab, choose whether or not to restore existing mailbox messages.

See [“Options for restores of Exchange Server mailbox objects or public folder objects”](#) on page 182.

- 11** You can restore individual mailbox items to alternate mailboxes or mailbox folders.

See [“About redirecting a restore of Exchange mailbox or public folder objects to a different path”](#) on page 186.

- 12** Click **Start Restore**.

Redirecting mailbox or public folder object from a mailbox backup

Reviewer: Added 12/20/12

Review the following requirements for redirecting the restore of an Exchange mailbox or public folder to a different path:

- You must indicate an explicit path (or full path).
- In the destination path, the following segment of the path cannot be changed:
 Microsoft Exchange Mailboxes:\
 Microsoft Exchange Public Folders:\
 If you change this part of the path, NetBackup attempts to restore the objects as normal (non-Exchange) files.
- The destination mailbox or destination folder must have an associated user account.
- When you restore public folders, change the public folder name to the folder to which you want to restore. This folder does not have to exist.
- When you redirect mailbox backups, if you modify the name of the Exchange folders, NetBackup restores the selected object to that specified folder name. These Exchange folders include “Top of Information Store,” “Views,” “Finder”, etc. You can see the new folder when you browse for backups and it is backed up on subsequent backups of that mailbox. However, you cannot use Outlook to view the folder and any subfolders and messages in that folder.

When you redirect a restore of mailbox or public folder items, consider the following examples:

- If you want to restore the contents of Mailbox 1 to Mailbox 2\Folder, specify the following in the **Destination** box:

Microsoft Exchange Mailboxes:\Mailbox 2\[mailbox 2]

For complete instructions see the following topic:

See [“Redirecting the restore of an Exchange mailbox, mailbox folder, or public folder”](#) on page 188.

- If you want to restore the contents of Inbox in Mailbox 1 to the folder Other in the same mailbox. Specify the following in the **Destination** box:

Microsoft Exchange Mailboxes:\Mailbox 1\Top of Information Store\Other

For complete instructions see the following topic:

See [“Redirecting a restore of an Exchange mailbox or a public folder object to a different path”](#) on page 190.

Debug logs for NetBackup for Exchange mailbox and public folder backup and restore operations

After you perform a mailbox or a public folder backup or restore, debug logging information is placed in the `install_path\Netbackup\logs` directory. A subdirectory is created for each process. The debug log file is named `mmdyy.log`.

For details on logging, see the *NetBackup Troubleshooting Guide*.

For backups, refer to the following logs:

- `beds`

This log is used mailbox and public folder backups using MAPI.

- `bpbkar`

For restores, refer to the following logs:

- `beds`

This log applies to mailbox and public folder restores with MAPI.

- `tar`

DRAFT

NetBackup Legacy Network Service

This appendix includes the following topics:

- [Configuring the logon account for the NetBackup Legacy Network Service \(Exchange 2010\)](#)

Configuring the logon account for the NetBackup Legacy Network Service (Exchange 2010)

Note:

Reviewer: Updated 12/15/12 Though this service is needed for DAG backups, Exchange credentials can be configured in place of the logon account for this service. 7.5 said you had to configure the service for "database and GRT restores". Lowell said that you configure this service for DAG backups. Which is accurate?

Previous to NetBackup 7.6, for Exchange 2010 DAG configurations you had to configure the logon account for NetBackup Legacy Network Service. The logon account required permission to perform Exchange database restores and restores with Granular Recovery Technology (GRT). This configuration is no longer required; configure the Exchange credentials in the client host properties. Existing NetBackup customers can continue to configure the logon account for this service. Include the credentials *only* in the host properties *or* for the NetBackup Legacy Network Service. Do not include the credentials in both places.

By default, the NetBackup Legacy Network Service uses "Local System" account to log on. A different account is required so NetBackup has the necessary local system privileges to perform Exchange 2010 DAG backups.

Note the following:

- Perform the steps on each database node in the DAG and on the CAS server.
- For an off-host backup, perform the steps on the alternate client.
- For backups and restores with GRT, configure each client that performs granular operations. To determine which clients to configure, see the following topic:
 - See [“Exchange granular clients and non-VMware backups”](#) on page 43.
 - See [“Exchange granular clients and VMware backups”](#) on page 44.

To configure the logon account for the NetBackup Legacy Network Service

- 1 Open the Windows Services application.
- 2 Double-click on the **NetBackup Legacy Network Service** entry.
- 3 Click on the **Log On** tab.
- 4 Provide the name of the account for NetBackup Exchange operations that you previously created. To change the **Log on as** account, you must have administrator group privileges.

See [“Creating a privileged NetBackup user account for EWS access \(Exchange 2010\)”](#) on page 50.

See [“Creating a minimal NetBackup account for Exchange operations \(Exchange 2010\)”](#) on page 51.

The account must include the domain name, followed by the user account, **domain_name\account**. For example, **recovery\netbackup**.

- 5 Click **OK**.
- 6 Stop and start the NetBackup Legacy Network Service.
- 7 Close the Services control panel application.

Index

A

- account for NetBackup Exchange operations, for GRT operations 46
